Our $n \cdot x$ issue will cor clude the valuable treatise on the Mexican Pateo process of working silver ores, which we have beenf for several weeks republishing from the "London Mining aud Smelting Magazine." The concluding portion, which will be given next week, is devoted chiefly to the phutosophy of the various manipulations, and will be found both valuable and interesting. Although this somewhat lengthy paper may be rather dry and uninteresting to the general reader, it will be found of much value and importance to all who are practically engaged in the difficult and intricate business of extracting silver from its ores. Notwithstanding, as intimated by the author of the treatise, much of the tedious Mexican hand and mule process may now be more advantageously and economically performed ly the aid of machinery, still the primitive modes of manipulation employed years ago, by the Mexicas miners, may be proftably stud ied even at the present day. There is little doubt, but that the general principles of the "Patio process," modified and accelerated by modera machinery, will prove the most economical and effectual method of working silver ores, which in the present condition of metallurgical and chemical knowledge, can be devised. We again commend to all interested a careful perusal of the treatise referred to. It will be found of as much value to the prospector, as to the "process man." It will be found almost invaluable to the prospector who would arrive at a practical knowledge of the val ue and character of his mine. It can be obtained in no other publication in this country, than the Solentife Press. We have extra files of the Press, from November last, which will be furnished at the regular sabscription price, and which contain mucl reliable matter, other thon the treatise upou working silver ores.

## THE DIOS PADRE MINING CO.

The mine belonging to the Dios Padre Colupany is situated in the Alamos District. State of Sonora, Mexico, and adjoins the celebrated mine of Almadre,, $\uparrow 5$ miles from the port of Santa Barbara. 'There is a good wagon road from the port to the mine.
This company was organized in November 1862, with a capital stock of $\$ 960,000$, divided into 1920 shares of $\$ 500$ each. The Company holds 2400 feet in length. The, ve in is a very heavy one being about 40 feet wide, and has been opened by a shaft to the depth of 220 feet, which is substantially walled from the bottom up. The mine is so situated that it may readily be drained by a tunnel to the depth of about 500 feet. A mill to be driven by a seventy horse power is now in process of construction. Ten stamps will be put up at tirst, to be subsequently increased to forty. Wheeler's amalganating pans and separators will be employed. The mill will be ready to start about the first of June next. Aoout $\$ 75,000$ have been expended in opening the same and erecting the machinery.
The Company's office is at No. 10, Armory Hall, in this city, and the present officers, are Ira P. Rankin, President; II. A. 'Talbert, Treasurer ; J. F. Nesmith, Secretary, and Ira P. Rankin, E. W. MeKinstry, T. A. I'aibert, C. H. Bradford, D. Maddux and F. Shackley, Trustees.
Stook Board in Sacramento. A Board of Stockbrukers has been formed in Sacramento. The meetings will be held daily from 2 to 3 P. M. at Court Honse Block. The terms of admission for the present are fixed at $\$ 25$ initiation fee and $\$ 3$ monthly dues.
Trifles Licit \&s Alr.-The winds which come over to us frcm America have at all times held in their loftiest currents, and carried over to us that remarkable dust which they sweep up from the summit of the Andes, or the arid pampas of South America. The dust has beeu deposited on the north const of Africa, on the Pyrences, and even on the snow clad flelds of our Alps; and in it, in our days : German natural philosopher has diseovered atoms of Amer can soil, of Brazilian rocks and thousands of the small light liodies of mieroceopic animals from the banks of the Oronoco.-Kohls Discovery of mals from
America.

## mining stocks in virginia city.

The stock excitement which, within the last two or three weeks has been gradually decliniug in San Francisco seems to have been transfered to Virginia City. The business of that place for the week ending with Saturday March 14, footed up at about $\$ 250,000$. Nearly evi ry class of stocks in that city are advancing, and many who have hitherto kept aloof from minng speculatiou, have caught the infection, and are converting all their surplus cash into "feet." The recent extraordinary successes of several of the first class mines, and the rapid advance of stocks geuerally, has beeu the exciting cause of this sudden activity. There appears to be no limit to the amount of capital, home and foreign, offered for investment. The namber of transfers during the week under review were very numerous, and embran ces a large variety of companies, some of whicls are seldom heard from in stoek transactions. Gold Hill stocks, of sec ond and third class, seem to have come in for an unusual share of attention. The various lawsuits in pendancy ap. prar to have caused some fluctuations in such stocks as were thereby affected, as favorable or uufavorable rumors were set on foot. The legal differences between the Burning Moscow and Madi-on seem to embrace a large share of attention, both there aud in this city. Several mammoth "cards" lave be a put forth by the friends of the contending parties, much to the pecuniary benefit of a leading San Francisco daily. Our compilation of "Remarks" for the week, which will be found in another column, is very full, and affords abundant evidence of a most unusual degree of activity.

## NEW AMALGAMATOR

A new gold and silver amalgamator, containing several new and important principles in its construction, may be seen at work every day, at the Miners' Foundry, on First St. This amalgamator has been patented by Mr. West, को practical Washoe silver ore worker. One of the prominent features in this pan, is the introduction of a copper steampipe around the inside circumference, which operates as a most admirable collector of the amalgam, nearly all of which is always found at every "clean up" adhering to this pipe. When the amalgam is once brought in contact with it no action of the machine can again separate it, bot if remains permantly fixed, until the pan is cleaned up. Other improvments have also been introduced in the shape and movements of the mullesr. We would advise quartz men to call and examine this pan for themselves. The results of the operation of this pan as compared with those now in general use are said to be greatly in its faver. It can be obtained at the Miners' Foundry.

List of Minina Companies.-We give, on the first page of the presat issue, a partial list of Incorporated Mining Companies, which have their offices of business in this city There will undoubtedly be found many inaccuracies in "the list, which we shall correct as fast as they may be discovered or whenever they may be handed in to us. Secretaries of Companies, and others interested, will confer a favor by sending to this office a memmorandum of any errors or omissions which they may notice. A number of adoitional companies will appear in the next issue. We shall continue the table from week to week until it is correct and complete.-after which time it will be published monthly and corrected, as changes and additions occur.

Tie "Oregon" for Mexicay Ports.-The steamship Oregon, Captain Wakeman, sailed for Mazatlan and Guaymas Monday. This ve-sel was completely loaded with marchinery and merchandise for those ports, and had to refuse large quantities of freight offered. The maehinery on board was ordered by mining companies which were cumposed almost exclusively of Americans. It is stated by parties in the boiler and machinery business that enough of those manufactures is already ordered to occupy all the room on board the Oregon which may be available for such purposes on her next trip. A large number of passengers went down who profess intending to engage in mining operations.

We are indebted to Hon. A. A. Satares for several valnable public documents, and for ot are favors.

## WASHOE STOCK REMARKS.

[Compligo qhom the Dally Trbratorlal Eatraprise.]
There has been considerable life in low proay Fvicesing, March 0, 1863. number of transfers have been made. Harrison, Geller Ledge (the iveorporated yortion) has been inquired for at $\$ 8$ @ 10 , and filty or sixty feet for activity is doubtless basod on an inteat to force the Harrison into prom inence as a contestant for the Malison-Hoscow ledge. The Hazel Green has becmeate in at $\$ 4$ (a) $\$ 6$, with largo orders from below; 50 rect sold at $\$ 50 ; 25$ feet at $\$ 175$; and 30 feet at $\$ 5$. Birdsall is also in brisk demand at $\$ 20$, with little in markot; 19 feet sold to-day at $\$ 21$. Yellow Jacket is
firm at $\$ 350$ @ 400 : five fect sold at the latter figures. El Doradois saleablo at $\$ 55$ © 60 , with an upward tondency. For Uuivn (Gold Hill,) $\$ 35$ (a) 40 is offered, with littlo disposition no the part of holders to gell. Texas in selling at $\$ 7$ @ 750 ; 40 , feet suld at $\$ 7$. Grase Vulley, 25 feet sold at 950 . Zousve is in $\log$
San Francisco.
TobsDay Evenisg, March 10th, 1863.
There has been considerable animation iu mining shares to-day, and a There has been considerable animation in mining shares to-day, and a
number of beavy trausters are reported. Uuiou, Gold Bill, udvauced $\$ 15$ during the day; and $\$ 50$ (3) 55 in offered this evening. Probably 151 fee chauged hands at from $\$ 48$ to $\$ 55$. Bullion is in light demand, and 37 teet
were sold at $\$ 40$ @ 4250 . Hazel Green bas sold pretty extenoively at $\$ \$ 50$ were sold at $\$ 40$ © 4.250 . Hazel Green bas sold pretly extensively at $\$ 450$
@ 5 , and is still salealle at these figures, to fill orders from below. Belvi@ere has been inquired for to day, 100 feet guld at $\$ 20$. Beach \& Paxtun 18 alvancing steadily, It is saieablo at $\$ 175$ (3) 260 per foot. There has heen some iuquiry for Burnside al a shade below San Francisco quotitions, without sellers.

Wednespay Efentig, March 11th.
This has been a day of excitoments-not one of two, but of a dozen a least. Everything-positively everything-is advancing, and money is freely offered for investraent. Gold Eill stocks have been the especial rage although Virginia has nut beeu neglected. First, let us speak of Gold Hill. The Eureka has beon sought for at a healthy advance. In the morning it was sold at $\$ 25$, but it reached $\$ 40$ by $40^{\circ}$ clock P. Ir., at which figures it may be fuirly quotod. Nou less than 200 feet changed hands. Leon, a cilum which yesterday might have been bought at $\$ 4$ and 5 , is now saleable
at $\$ 20$ with as many buyors as sellers . The Leon is located in froat or Crown Point. The Overman has been in request all day at $\$ 12$ (a) 15, with abundance of buyers. Not less than 250 feet were sold. The Belcher has also been in lively demand, and is suleable at a decided advance. Litteleas
changed hauds, owiug to a disposition on the part of orners to hold. A changed hands, owlug to a disposition on the part of owners to bold,
very rich ledge has been struck near and in front of the Sinalon, and supposed to be a distinct vein. It assays largely, and has created something of an excitement. Twelve fect fold to-das at $\$ 75 \mathrm{per}$ foot. Yellow Jacket is quict. It is offered in small lots al $\$ 325$ (3) 350 without takers. We now tarn to $\nabla$ riginia. The Mercdith suldenly advanced to $\$ 40$ to daky, and the tendency is atill upward. The ledge in the lower tondel of the mine bas re has been marketahio at \$20, with a number of sales at these figures. Birulsalk is in brisk demand at 2250 (3) 25 ; 39 reet sold at 2250 . El Dorado
is kaleable st 89750 © 00, with liztle in market. This rterks is on the adance. Znirave in dullat sito. No tramenfern in this stuck are reported.
 weft of Virgmia, Has just beenaleared by the "Brets Company." The locality is new. An ansay of the cropplogn shows $\$ 4750$, priacipalify in silver. The bolders ure somewhat excited.

TUuradiy Einstrg, March 12 th .
There lhas been considerablo less feellug in stocks w-duy that y yesterday, although she shares dealt it are scarculy less buyyun. The certainty of a chultet whit the Belcher bus nomewhat conled the ardor of the ewners in the uewly develuped vera in front of the Nimnloa, at Gold Hilt, tut the price of the ground is stifly maintaibed, and noue has changed hatad to-day in the market. The Belcher and Overman are still iu demand-the former nt $\$ 26$ @30, and the latter at $\$ 16$, with mure buyers than sellers. The Sinaloa and Leon are in request-the Jatter at $\$ 325$, and Coion at $\$ 50$. El Dorado und Birdrall have hind somethiog of a run to day. El Derado is indemand at S75, with few sellors. Birdsall has adranced duriog the day to ${ }^{2} 55$, with abundance of buyers. Meredith may be quoted at $\$ 40$. Kenosha has been seling at $\$ 15$, and is lo demand, owing to furorable indications in the tunnel of the mine. Beach \& Puston is Raleuble at $\$: 00$, with little in market. Buruside is in request at $\$ 50$, with po sellors ; $\$ 70$ to 75 is acked. Huzol Green is dull at $\$ 5$, Zouave at $\$ 20$, Orientalat $\$ 7$ @ 8 , Texas at 87.

## Frimay Etening, Mareh 1ath.

Little has beon done in stocks to-day, in comparison with the early par of the weok. Over excitement, iuevitably reacts in prostration. This is a financial as well as a physical fuct. Trado is quiet in Gold Hall. The Bay State engrosses attentino, and the Overman und Beleher are in demand Massiton is being dealt in at $\$ 10$ (c) 12, and a snle of twent 5 - ife feet is reported at $\$ 15$. The Princess, adjniolog the Uaion, is foding buyers at figures not reported. In Virginia but few sales aro reported, and nonc of these at adrunced rates. For Burbside $\$ 50$ is offered without accommodation. Soutt: Burnside is saleable at $\$ 0$ to 37 . Birdsall is stimy mannesined at $\$ 35$ (a) 40 with little in market. A small lot of Beach \& Paxton sold to-day at $\$ 300$ pershare. This is first sale of this stock reported for some weeks. Tweoty-five feet of Rogers, Virginia district, sold at $\$ 40$. We quote El Doradoat $\$ 70$ @ 75 ; Moredith at $\$ 40$; Sucramento at $\$ 80$ @ 8250 ; Ketrosha, $\$ 15$; Osceolit, $\$ 10$; Sunta Rita, $\$ 35$ to 40 ; Oriontal, $\$ 6$; Hazel Green, $\$ 5$; Kuystove, $\$ 15$ (3) 20 ; Pride of Washoe, $\$ 15$ @ 20 ; Zounve, $\$ 19$ (1) 20 ; Belvidere, $\$ 20$; Fairviow, $\$ 15$ (a) 20 ; Bullion, $\$ 10$ (a) 45 ; Union, $\$ 50$; $\mathrm{Bu}-$ chauan, $\$ 100$; Yollow Jacket, $\$ 300$ © (a) 325.

## saturday Entanyg, March 14, 1863.

The business of the week foots up largely, stucks to the amount of not less than $\$ 250,000$ having changed hauds siace Monday. Burnside is in Ligh request at $\$ 50$, witl few sellers. South Burnside is saleable at $\$ 6$ (a)
7. There is something of a dematd for Jadison at a shade below san Fran7. There is something of a dematd for Madison at a shade below san Fran-
cisco quotatians, but tho rumor of a comproniso is not implicity credited, and it is deult in cautiously ; thirty-five feet sold at $\$ 28$ © 30. Birdsslt is in request at $\$ 37$ @ 40.25 feet sold at these figures. The possibality of a suit with the Durgan has somewhat deprossed the Oriental, and it is offered at figures beluw our last quotations. Bullion is quiet, with an upward tendeacy. Eighty feet suld yesterdny at $\$ 45$. Peytona is in demand at $\$ 30$ to 35, and Kenosha at about our last quotations. Buach \& Paxton is held fur a hoavy advauce. There is considerable action in Gold Hill stocks. Ray State cannot be bought for less than $\$ 100$ per foot. Leon is marketable at 20 (a) 25. Dunn is held at at $\$ 10$ 11. Branch Mint is in demand at $\$ 25$. Juiou is quoted at $\$ 50$. The following sales are reportod by Platt \& Low, of Gold Hill: 12 feet Fuller at $\$ 15 ; 5$ feet Eurokin at $\$ 30$; Huwkeye at $\$ 15$ (1) 20 ; 50 feet Overman at $\$ 20$; Massellon, $\$ 8$ (1) 12.

## ESNERALDA STOCK LIST

[Corrected Weekly for the Mining and Scientific Press.]

## transactions of the week.

Of sales during the weak, the following only were submitted for report,

Loss of Silver.-The loss of silver in this amalgamation process 18 considerable and varies much according to the class of ores operated upon, and particularly on the quality of the grinding, on which depends very much the success of the operation. From 10 to 14 per cent. is an average loss on docile ores; much of this, however, is lost in the form of amalgam from being carried away in fine particles by the water used in washing the tortas; but if more perfect washing vats were employed I have no doubt but the loss of silver could be much decreased.
[TO RE CONOLUDED NETT WEEK.]
*. monton 32 quintals.

## THE ESMERALDA MINES.

We condense the following from the Esmeralda Star of March 14th :
The Pond Ledge on Last Chance Hill, far exceeds anything yet struck in the District for richness in the precious metals. The slaft on this lode has reached a depth of 100 feet, and not a dollar of assesments has the company been compelled to levy in the working of it. Some of the rock will yield several thousands of dollars to the ton. 'The ledge is about niue feet thick and enlarges as it goes down; the rock is decomposed quartz. The lode is 120 ) feet in length, and no danger of conflicting with any other lode.
The mount Braley Company have just commenced running their tunnel, and we understand that the work will be continued day and night.
New Esmeralda is being prosecuted with energy. The Company owning it have gone through one ledge about fourteen feet in width, and will probably get through three more in about thirty days, when they will commence drifting and takiug out ore for crnshiug. The Company intend putting up a large mill this spring.
The Montreal Tumnel, which is located a short distant below the Heath quartz lode, has now reached a distance into the hill of one hundred and thirty feet. This tunnel was lo. cated as early as December I861, and will be one of the best paying enterprises iu the District, as it is ow ned by working men who are determined to push the work with vigor.
The Portland ledge, on Martinez Hill, is turning out excelleut rock; a shaft has been sunk 46 feet, and the ledge is now five feet wide. We learn also that the Polar Star is turning out splendid rock, but the owners, J. B. Herbert \& Co., have been compelled to suspend work, not being able to flnd work men to work even at the high rate of $\$ 12$ per foot in sinking the shaft.
The Golden Cross lode on Last Chance Hill, is being worked day and night, and the rock is hauled to Gregory's mill for crushing. This ledge is 1200 feet in length, and is one of the best ou the hill; the result of the crushing we have not yet learned-the rock is rich and the company owning it say there is no reason why the mill should not prove it to be so

Mrners Wanted.-Three hundred miners at- least are wanted at the present time, and there is or will be an increased demand for meu. Work has been compelled to be suspended on some of our best lodes, for lack of workmen. The mills are sadly in need of hands. $\$ 4.50$ per day is the wages of miners, and foar for men to work in the mills. The Last Chance Tuauel, being run into the hill of the same name has reached a distance in the hill of sixty feet, and is being run day and night. The Tunnel is admirably located for prospecting the hill and reaching the many blind lodes known to be runnang through the hill.
The General Hooker quartz lode, sitnated on Silver Hill, between the Antelope and Utah, is still yielding rich roek.
The upper shaft is now down to the depth of fititeen feet and the ledge about three feet in width. Ten dollars per ton has been offered for all the rock taken out by the company, delivered on the ground. The company, we are iuformed, are $f_{\text {ree from debt, and have never yet levied any assesments. }}$

There is a scheme to construct another tunnel under the Alps, the point being settled at the Simplon. The total length of the proposed tunacl will be about 4506 metres.

Mining Directory.-We have in course of preparation
a "Minging Directory," whereir. will appear, in tahular form, all the Incorporated Mining Companies, which have offices in this city, the names of their Secretaries, place of office, lo cation of mine, etc., etc. This table will be corrected monthly , and will prove of great convenience to the public. We had intended to have had it ready for this issue, but it is unavoidably postponed until next week.

## Dr. Van Zandt, <br> Consulting Physician and Surgeon OFFICE: <br> Corner of Washington and Sansome Streets.

The Great Success of this Century, as an Aid to Practical Medicine.

The Mystetious Problem of Material Nature, Electricity Made Subservient for the Cure of all Nervous and Spinal Diseases
THAT THITS PRINCIPLE, successfilly applied to diseased states Dor the system, is to prove the great sought-for necessity, loog wanting by physicians to aid their medicines in overcoming orgamic and functiound
dernugements of the human body it a part of the great priuciple of vitality knowr as nervous lufluence and necessarily must have much to do in obviating diseased action.

## Oo Much Cannot Be Said

In its praise ; for it is bighly probable that in health there is an exact equipoise of health ene prokic principle; and should this secret and hidden equitrifed when it should be positively charged-is not the current broken, and is there not a war of forces going on in our system? This necds correcting aod in order that the tissues of t
agonts we must Grst restore and

## Awaken the Magnetic Lite Within Us.

The spinal and sympnthetic nerve systems. Belheving ar I do most firmly in this grear magnetic or electrical jutensity of the carth, with its influence

## To Printers.

An Intersest in one of the most nourashing and best paying Ne per Olfices in the mountains is nfered for sale on easy to:ms. A rari
portunity is hereby prescuted to any printer desirous of eatablishing l self in a good business in one of the healthiest, most thriving and del cul mountain towas iu the stato. For furtber information enquire an affice.

Subscribe.-Are you a miner and not a subseriber to Mining and Somentrite Preas? If so, you are an an oser of many times the price of a year's subscription, ticularly if you are engaged in quartz mining. The amount of practical information, important to miners mechanics, which is contained in a volume of the Press, $c$ not be bought from the shelves of any bookstore in the eo try for the price of several year's subscription. Do you e send a paper to the "Old Folks at Fome?" If so, and desire to send important information and valuable read matter, sou can find no paprr that will be read with so m eagerness by them, or one that will convey to them an account of the real industry of the country as the ng and Scimntific Press. We invite all to seud us names and fow dollars, or two dollar: for six months, become patrons of the only mining paper printed on the cific const. Those who receive a paper with this paragn nalked may understand that it is sent to them for exa approval as to Wurrant their subscribing for it at once. not our usual custom to receive a subscriber for less six months; but inasmuch as we are anxious to intro the paper where it is not now known, we will, for the $p$ ent, send the Press for three months even, on the recelp one dollar, in coin or staups. It is our belief that no will wish to discontue the paper after being a constant ir er of it for even that short period.

## SUGGESTIUNS ABOUT FOREIGN PATENTG

American inventors should bear in mind that, as a gent rule, any invention which is valuable to the patentee io country, is worth cqually as much in England and some n foreign countries. Four patents-American, English, Fre and Belgian-will secure an inventor exclusive monoply his discovery among one hundred millions of the most int gent people in the world.
The facilities of business and steam communication such, that patents can be obtained abroad aimost as easy at bome. The majority of all patents taken out by Am cans in foreign countries are obtained throngh the Mrs and Scientific Press Patent Agency. Haviog establi ed agencies at all the principal European seats of Gopi ment, we obtain patents in Great Britain, France, Belgi Prussia, Austria, Spain, ete., with promptness and patch.

Models are not required in any European country, but utmost care and experience is necesaary in the preparation the specifications aud drawiogse

When parties intend to tak out foreign patents, engl ings should not be published until the foreign applicat have been made.
Caution.- It has become $n$ somewhat common practice agents located in England to send out circuiars soliciting patronage of American inventors. We caution the la against heeding such applications as they may otherwise into the hands of irresponsible parties, and thus be defrat of their rights. It is much better for inventors to ent their cases to the care of a competent, reliable agen home.

While it is true of Most European conntries that the tem of examination is not so rigid as that practiced in country, jet it is vastly importont that inventors should $t$ their parers prepared only by the most competent solicit in order that they may slaod the test of a searching lega amination; as it is a common practice when a patentee $t$ a purchaser for bis invention, for the latter to cause such amination to be made before be will except the title.
It is also very unsafe to intrust a valuable invention to other than a solicitor of known integrity and ability. I tors should beware of speculators, whether in the guis trusted with valuable inventions.

Amalgamating and Separating Pans,
It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.
The most important principle connected with the ope ration of these Pava is the separation of the trituratiag process from thit of extractiug tom amaigam from the ses from the passing off of the same in combination with the quicksilver, during the proces of trituration, and in cleaning up. By the introduction of the Separating Pau to follow the trituration this loss is entirely avoided. Working these machices there is do arpreciabletas.
quicksilver, and hence none of the precious metals.
Where these pans have been introrlvced and operated by the side of others on sands from the same rat, the of metals over its competitors, as well as a still larger percentage in the amount of work performed.
** These Pans man bescen in daily operation, at the Miner's Foundry, on First street in this city, where alf interested are invited to call and examine for themselvea no16-tf ZENAS WHRELER.

## MRS. HATIL'S SMELTING FURNACE.

Wo are led to believe from a hrief paragraph in a late mber of the Virginia City Union, that the experimental rnace which it was recently announced was in course of ,nstruction, after Mrs. Hall's patent, has proved a success. - have ever hul much coufideuce in the invention and all not abandon the same until its failure shall be demonrated by a fair trial on a practical, working scale. The inciples combined in the construction of this furnace are idently correct in a scientific point of view, and most unrestionably comprise many and important improvements erany other furnace ever constructed. The principal ature of the invention is an enlarged and practical appliftion of the blow-pipe of the labratory to the most extenve reduction works which it may be desirable to construct. Another important principle, and one which we believe be entirely new, is the application of a cold water apparas for condensing and precipitating any volatilized metals, hich may be thrown upward by the intense heat and draft the furnace. Those of our readers who are familiar with e discussions which grew out of the supposed loss of gold volatilization at the Mint in this city, while that institu on wgs under the direction of Col. Harazthy, must be vare that there is liability to much loss from this cause. t that time numerous ingenious expedients were resorted to condense those fumes, but, apparently with very unsatfactory results. Mrs. Hall has most unquestionably suceded, perfectly, in accomplishing the object sought for, in fin, by numerous iugenious metallurgists and mechanics st and present, and that to by an arrangement, so simple hd cheap, that it is an especial wonder that no one should we thought of it before. A very correct description of is apparatus is given as follows, by a late correspondent of e Evening Journal of this city :-
It consists of a receiver, into which passes the flue of the rnace, and in which the flue terminates or is cut off, and thensurmounted by a conical cap, like a draft-cap of an dinary smoke pipe or chimney. From beneath this cap e fumes pass into the receiver, where they come in contact fith a heavy shower of cold water from a sieve in the top, sembling the shower sieve over a bath tub. An opening the centre of the sieve allows the draft to continue from le fue to the outer-air. Thus all the fumes are subjected
condensation without any loss of neat in the furnace ; inced, the beat is rather increased by being confined and rowa back by the cold water coming in upon the flue. hen the water in the receiver reaches a certain height, it carried off by a waste pipe, placed at a level below the atlet of the fiue.
In addition to the series of blow-pipes, by which a large mount of oxygen is forced into the furnace, jets of steam realso, from time to time introduced, which greatly aid in le oxydization of the sulphurets. An important chemical peret, also involved in this invention, is described by the riter in the Journal, already quoted, as follows:-
"Carbon and sulphur both combine readily with every nown substance; but their affinity with each other is closcthan with any others. When placed in contact in proper roportions, if heat be applied, carbon rapidly absorbs and mbines with sulphur in fumes, and they pass off together
Then the sulphurets of the metals are heated on a charcoa When the sulphurets of the metals are heated on a charcoa
apport, the separation and absorption of the sulphur pro
ceeds much faster than the oxidation of the metals, and consequently their reduction to a fluid state is secured in a period of time proportipned to the intensity and rapidity of the combustion. This is because both carbon and sulphur haves a stronger affinity with oxygen than the metals have and combine more readily with it.
It is plain, therefore, that in an intense heat produced by a strong blast of air unon charcoal, the facility of reduction of metals must he in direct ratio with the desulphurizing of the same by combination of the sulphur with the carbon and oxygen. This, it is claimed, is most thoroughly performed by the series of blow-pipes, jets of steam, and cold water show ers, which form a part of the construction of the Volcanic Smelting Furnace.
We understand that an experimental furnace, capable of smelting one ton of ore at a lime, is now in process of erection in this city, and will be ready for operation in a few days, so that those of our citizens who may be interested in the success of this promisingly important invention will soon have an opportunity of seeing it put to a practical test. If it succeeds, it will be of vast utility to the recently developed copper interests of the State, and by its simplicity and economy, render available millions of tons of ore, which can be of little or no value in this state, under any other known system of reduction.

## OUR MINING LIST.

We continne our Mining List to-day. During the week we have added fifty-four additional companies, making the present number, all told, two hundred and three Mining Companies, who have their principal offices of business in this city. Of this number 30 are in California (19 in the Slate Range District); 14 in the northern States of Mexico; 62 in Esmeralda and districs on the Eastern Slope to the south of that point; 84 in the region about Virginia City and the balance, 13 in number, in the Humboldt region.
There are numerous other companies, incorporated a San Francisco companies, but we have confined our table to those only who have regularly established offices in this city. No doubt we have omitted many, in our search, and we should be happy to add all such to the list as fast as they are handed in. Many errors in our last week's list have heen corrected, but doubtless others still exist which w shall correct as fast as they come to our knowledge. have lists also in preparation for such as have their offices in Virginia City and Esmeralda, which will appear in due time There are many important facts, statistical and otherwise connected with these companies, which we shall speak of in future issues of the Press.

The salvors of treasure from ibe Golden Gate, have recov ered between $\$ 600,000$ and $\$ 700,000$. They offer to compro mise with all shippers at 50 per cent. Some houses have al ready settled at that rate.

Mirrors of the World. - The proprietors of Wolfstenberg's celebrated Panorama will exhibit the same at the Eureka Theatre, in this city, for "this week only," commencing this Evening. This is one of the finest of this class of paintings, which has ever been produced, and is well worth

## MINING CORRESPONDENCE.

## Grass Valley, March 25, 1863.

Frifnd Ewer:-Our town, the scene of so many excitements in quartz. is again all alive with "copper." Every one is wild with the copper fever, prospecting being the orler of the day. The cause I it being what certainly seems to be a genuine bona fide Copper Mire, on Rouse's Ranch, about two miles below the town. This ledge has been known to exist for some years, but having been tried for gold and failed, it gradually fell into discredit. Sometime during last November or December, Mr. John Armstrong, formerly a well kuown resident of this place, but who had made San Francisco his residence for some time, visited his old home, and quietly located the ledge as the Excelsior Sulphuret Mine and I suppose took specimens of the rock with him below, at any rate, a short time after he left here, Mr. E. Maslin (late District Atty. of this Co.) was seen to doff the Lawyer's stately suit of black, and put on the grey shirt and other toggery of "yr honest miner," and pitch into the "Sulphuret Mine" in decided earnest. It soon leaked out that copper had been discovered, and then the rush began, the country around about was staked off and claimed all over almost even

## "Down to Eartlu’s profound

Aud up to Heaven."
And I will venture to say that to-day there is not a man in Grass Valley, who has cot somewhere about his clothes a piece of rock that he firmly imagines contains copper. I see from the papers that a company has been formed and incorporated in your city, kuown as the Nevada Copper Mining Co., and it is believed here that men of wealth and influence are connected with it. Centain it is that should this discovtry prove what it gives every indication of being-a genaine Mine-it will add to the already abundant mineral wealth of our town, enough to make this "Valley of Grass" the banner town of the interior and, to those who quietly yet energetically have discovered and developed this new phase of our mineral life, will be due the thanks of our community. I will keep you posted-shall probably visit the mine, to-morrow.

Miner.
Concluden.-In to-day's issue we conclude the valuable and interesting treatise upon the working of silver ores, by James Napier, Esq. Mr. N., from a long residence as Chemist and Assayer at the Mexican Mint, in one of the the most extensive silver mining localities in that country, has abundantly prepared himself to write understandingly and fully with regard to the method and manner of working silver ores in that country, and the philosoplyy of the same. T'hese numbers, to persons engaged in working silver ores, must prove most acceptable and valuable, while the general reader, will duubtless be pleased that the series is concluded, and more room afforded, in our columns, for other matters.

Copper has been found at Queen Charlott's Island, near Victoria. Coal of a very superior quality has also been found within three miles of Port Angelos.

## MINING AND SCIENTIFIC PRESS

combine with mercury. If, for instance, metallic copper, in the form of precipitate, with a little salt as an exciting agent, be added to an ore containing sulphide of silver, metallic silver and sulphide of copper will be the result. This result will be more or less perfect, according to the conditions under which the experiment is made. If the ingredients be ground in a mortar, the result will be rapid; but if mercury be now put with this, it will form analgam but reiy slowly indeed, unless heavy friction be used. On the other hand, native silver, and metallic silver, formed by precipitation from the sulphate by copper, or by many other means, will ammlgamate with greater ease; so that the silver in Dr. Uslur's experiments might actually have bean reduced to the metallic state. but would not amalgamate in the torta; and such probably was the case. I have repeated these very experiments of Dr. Uslar or a smaller scale; that is to say, 1 took the usual proportions of salt and sulphate of copper, and mixed with them moderately rich silver ore. After these had remained in contact for about twelve hnurs-part of the time exposed to a tropical sun-the experiment was divided into two portions; to one was added a small slip of very bright metallic copper, and to the other a piece of polished iron. Almost the moment the copper was added, it became coated with a white precipitate of silver; silver was also precipitated on the iron, but not until it had been in contact for some time. Again, if we take into consideration the small proportion of metallic silver there is in the torta, compared to the enormous amount of earthy matters present ; and also the small amount of mercury, and that the two metals would have to be brought into actual contact before they could combine; it would, I think, have been rather strange had amalgam been formed. It is not enough that silver and mercury be brought iu contact with each other to make them combine; but, in many cases, it requires heavy friction; and in a thick pasty mass like a torta the difficulties would be much increased. When the chloride of silver is in solution in common salt, then we have a chemical action going on by which we can better understand why amalgamation takes place.

The next argument used against the formation of chloride of silver is founded on the fact, that it had fanled to be detected in tortas which had been left in the patio for months, without mercury I presume. The following experiments made by myself myself may entirely account for this

The first experiment was on pure sulphide of silver. To this was added a small portion of bi-chloride of copper and salt, and the result was an abundant formation of chloride of silver.

The next experiment was made with common silver ore of moderate richness, which, besides sulphide of silver, contained also sulphides of iron. To this were added the usual quantities of sulphate of copper and salt, and the result was, that chloride of silver was formed after a few hours' standing ; but, at the end of three days, I was surprised to find that the whole of the chloride of silver had again disappeared. The experiment was prolonged for three weeks, and tested daily for cbloride of silver, thinking it might reappear; but it did not. This experiment was repeated at various times, and with different ores; and in every case chloride of silver was formed, but in some instances only did it disappear on standing. I may here observe that the chloride of silver held in solution at one time in a torta must necessarily be very small, from the fact that the quantity of salt used is only sufficient to hold a very small quantity in solution at once ; so that in making such experiments as the above-unless the ores used be very rich, and a large excess of salt be added-one must not expect to obtain an abundant formation of chloride, but rest contented with finding a moderate proportion, as the process is one which goes on but very slowly indeed.

It became a question why the chloride of silver, when once formed, disappeared again? This I tried to discover by numerous experiments on a small scale. In tortas, where large quantities of sulphide of iron, particularly of the white variety, was present, the chloride of silver was decomposed, and chloride of iron formed; the silver being again probably converted into sulphide. [With artificial sulphide of iron, chloride of silver is very rapidly decomposed; particularly when heated.] Sulphides of copper had no action on chloride of silver. Where galens was present, the chloride of silver was very rapidly decomposed, and chloride of lead formed. Blende had a similar effect ; and this may
explain why in Zacctecas, and some other districts where the ores cuntain blende, and sometimes small quantities of
galena, they are obliged to use an excess of magistral for the purpose of first decomposing these sulphides. We are al so aware that if sulphate of copper and salt be added to galena and blend, that chlorides of lead or zinc would be formed ; and there are doubtless, many local actions taking place in tortas, which may vary very much with the nature of the ores operated upon. I have witheld many experiments made on a small scale on the subject; believing that it is only by close attention to the many various changes which take place in the tortas themselves, that a true knowledge of the theory of the patio amalgamation can be arrived at, and that laboratory experiments often only tend to lead us astray, unless corroborated by actual results on a large scale.

To prove furthur the formation of chloride of silver in the operation, I have obtained numerous samples of torlas in actual operation, after the salt and magistral had been added, but before the addition of the mercury. In every case did I find chloride of oilver; and even when the mercury was present, in tortas far advanced, ehloride of silver was always found. My general method of testing was to digest the sample for a short time in a solution of hot common salt; then filter, and add to the filtrate a clean plece of copper, upon which the silver was precipitated. In some cases the sample was digested in weak ammonia, filtered, and an acid added to the filtrate, which precipitated the chloride of silver.
From what has been said, it is very evident that, at the commencement of the amalgamation, there must be a considtrable quantity of free chloride of copper present; because the whole of the ingredients necessary to carry on the operation to the end are added at once, and yet the torta does not become hot-provided of course the ingredients have not been added in excess. How is this? The only answer 1 can give is, that the patio amalgamation is founded on the affinity existing between sulphide of silver and chloride of cspper, and that if the torta become hot at the commencement, when an excess of raterials were not added, then we would have no such process as the patio.
When a torta is very hot, amalgamation does not go on nearly so rapidly as at other times. This may be owing to the mercury becoming covered with a coating of chloride, thus preventing the chloride of silver from being reduced. Now, according to Mr. Bowring's theory, that the first action which takes place is the conversion of part of the mercary into chloride, the torta ought to become hot at the very commencement, whereas such is not the case ; and to avoid loss of mercury in this way, Mr. Bowring proposes, and has patented, the use of protochloride of copper instead of magistral.
*Mr. Louckner, whom I have before had occasion to mention in these pages, was a gentleman of the highest scientific attainmenrs, and had studied closely, for upward of thirty jears, every thing cunnected with the reduction of silver
ores in Mexicco. He had also written what, I have no besores in Mexicco. He had also written what, I have no bes-
itation in saying, would have been the most valuable treatise which has yet appeared on the subject, but which, I regret to state, is lost to the world. In 1855, Mr. Louckner Was travelling from Angangueo to Guanaruato, having with him his MSS. At a certain part of the road he was attacked by robbers; and, on attempting to defend himself,
his pistols missed fire. He was then overpowered, robhed his pistols missed fire. He was then overpowered, robbed,
severely wounded, and left on the highway fordead. When severely wounded, and left on the highway for dead. When
he recovered himself, he found his papers and MSS. torn and scattered to the winds. Mr. Louckner died four and a half years afterward in Guanaxuato.
Lecture.-We had the pleasure of hearing Mr. Legh Harnett's auddress before the Bible Temperance Society on Sunday week, on "The Power and Genius of America." The address was not only an able effort, but a very grateful and gratifying tribute to our Country coming, as it did, from an educated Englishman. His sentiments he claims are but the sentiments of the great mass of his countrymen. If such be the case we may rest assured that the heart of England is with us in this hour of peril. The address occupied an hour in delivering, during which the speaker sustained himself with great ability, and showed himself thorougbly acquainted with the present condition and future destiny of America. Mr. H. is an unflinching Union man, and a firm believer in Manifest Destiny. Would to God there were

Subserrbe.-Are you a miner and not a subscriber to the Mining and Scientiric Press? If so, you are an annual loser of many times the price of a year's subscription, pare ticularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechauics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and yow desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MiNing and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examiuation, and with the hope that it may so for meet with theiri approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the pres. ent, enend the Prisss for three months even, on the recelpt of. one dollar, in coin or stawps. It is our belief that no one will wish to discontue the paper after being a constant reader of it for even that short period.

## SUGGESTIONS ABOUT FOREIGN PATENTS.

A merican inventors should bear in mind that, as a generalh rule, any invention which is valuable to the patentee in this foreign countries, Four patents-American, Eaglish,French and Belgian-will secure an inventor exclusive monoply to bis discovery among one hundred milions of the most intelli gent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy a at bome. The majority of all patents taken out by Ameri cans in foreign countries are obtained through the Minine and Scientific Press Patent Agency. Having estabhish ed agencies at all the principal European seats of Govern ment, we obtain patents in Great Britain, France, Belgiunin Prussia, Austria, Spain, etc., with promptness and dis patch.

Models are not required in any European country, but thi utmost care and experience is nec
When parties indend to taks out ings should not be published until the foreign applicatiou have been made.
Caution. - It has become a somewhat common practice fo agents located in England to send out circulars soliciting th patronage of American inventors. We caution the latte against heeding such applications as they maj otherwise fal into the hands of irresponsible parties, and thus be defraude of their rights. It is much better for inventors to entrus their cases to the care of a competent, reliable agent a home.
While it is true of Most European countries that the syi tem of examination is notso rigid as that practiced in thi country, yet it is vastly important that inventors should hav their papers prepared only by the most competent solicitor in order that they may stand the test of a seurching legalez amination; as it is a common practice when a patentee firc purchuser for his invention, for the latter to cause such ei amination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to an other than a solicitor of known integrity and ability. Invel tors should beware of speculators, whether in the guise: patent agents or patent brokers, as they cannot ordinarily । irusted with valuable inventions.

## SAN FRANCISCO MINING NOTICES.

Assessments libtied.
Assessmonts upon Miniag stocks have been levied as follows :-

Farabahli--Assessment of $\$ 1$ per share, levied March 20d.
Sutro.-Assessment of $\$ 1$ per share, levied Feb. 23, payable March 23.

Silver Quarts Mill Co--Assessment of 5 per cent. levied Feb. 23, payable March 28 .
Indvetia. - Assessment of 25 cts. per share, levied Feb. 17, payable March 10.

Zouave.-Assessment of $\$ 1$ levied Feb. 22, payable Mar. 22

Rogers.-Assessment of $\$ 5$ per share levied Feb. 4, pay-
able Mar. 15. able Mar. 15.
Sam Wright.-Assesment of 50 cts. per share levied Mar2, pay̧able immediately, delimquen's to be sold Apr. 2.
Nupuleon (copper.) - A ssessments of $\$ 3$ per share levied Mar. 3, payable in 30 days.
Golden Age.-Assessment of one dollar per share levied Feb. 24, payable Mareh 26.

Washoe (fold \& Silver.-An assossment of 2 per cent.
n capital stock was levied Feb. 16, payable Apr. 1.
Rholes' Digming. - Assessment of 25 cts. per share levied Feb. 26, payable Mar. 5.
Texas Co., at a Meeting held Fob. 14, levied an assessment of one dullar per share, payable to the Secretary in Virginia City.
Santa Roza Co.-February assessment of 20 cents per share now due and payable.
Madison Co.-An asses:ment, two dollars per share, was levied Feb. 17, payable immedıately, at Office, 600 Mer chant St.
Union Co.-An assessment of one dollar per share was levied February 16 , payable on or before March 25.
Pena Co.-An assessment of $\$ 3$ per share was levied
Feb. 5, one half payable March 1, balance April 15.
Kossuth Co., Devil's Gate District.-An assessment of 10
ts. per share was levied Feb. 7.
Constitution Company levied an assessment of 25 cts. per
eb. 11, payable immediately.
La Plara Oro Co. levied an assessment of five dollhrs per share, Feb. 9, payable at Office of the Secretary io Virginia City.
La Plata Co. levied an assesment of 50 cts. per share
Fub. 2ud, payable at Office of the President. Tub. 2ud, payable at Office of the President.
Alamo Co. levied an assessment of 50 cts. per share, Feb. 11, payable on or before March 20, at 115 Cal. Street San Francisco, or at office in Carson City.
Tucker Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.
Hawley Co. Ievied an assessment of one dollar per share, ou Fel. 9, payable on or before March 12, to Superintendan at the mine, or Secretary at Office.
Slate Range Co. levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.
Moss G. \& S. M. Co.-An assessment of 50 cents per
hare was levied Jan. 27, payable at 428, Montgomery St., or to the Superintendent at the mine.
White Cloud G. \& S. M. Co. levied an assessment of 55 cents per share, Jan. 27, payable to the Secretary, at 228, Montgomery śt.
El Dorado G. \& S. M. Co.-An assessment of One Dolar per share was levied Jan. 23, payable to the Sec. or to the Supt.
Gaudaloupe S. M. Co.-An assessment af $\$ 30$ per share was levied, payable on or before March 1st.
El Tesora Mining Co.-An assessment of $\$ 11 / 2$ was levied Jan. 27, payable at office on or befora Feb. 27 .
Polar Star G. \& S. M. Co. levied an assessment of cents per share, February 4th, payable on F before the 4th of March, at the Office in this city or the Superintendent at the mine in Aurora, (Esmeralda.)
Dios Padre G. \& S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, alsu an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.
Beckwith G. \& S. Mining Oo.-An assessment of 25 cents per share was levied Jan. 24, payable immediately.
Sonora Mining Oo.-An assessment of 25 cents per share was levied,Jan 23, payable imnediately.
Overman Mining Co.-25 eents per foot, Jan. 29, payable within ten days.
Chs. Caney Mining Co.-50 cents per share, Jan. 21, payable en or before Fel. 20th.

Sierra S. M. Co. An Assessment of 21.5 was levied Jan. 22-payable immedintely, ut Ollice 575 Ĩlissiun St.
Mount Ihavid-on Co.-An Assessment of 50 cents per Share was levied. Jan. 2\%, payable on or before March lat, ut Olfice 47 Montgomery Block.
Air atic.-Fifty cents per share, payable nt No. 4 Armory Hull, sian Francisco, or to the superintendent at the Mine. Hattio G. dz S. M. Co.-Thirty cents per share, levied Jan. 31, payable at Uffice in Sian Franciscu, or at the Mine.
Hale \& Noreso:8-Assessment of Ten Dollars per Share, levied Jan. 31-payable at the Office in this city, or to John Skap, at the Mine, on or before Feb. 25.
Mina Prieta S. M. Co.-An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or before March 5 th-at Office, cor. Montgomery \& Jackson Sts.
Recorder Mining Co.-An Assessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and balunce on or before Marcla 20.
Hale \& Norcross s. M. Co, have levied an assessment of $\$ 5$ per share payable on or befure Jan. 26 th.
Martin White.-Au assesement of 20 cts. a share was levied, Jan. 2.
Oriental G. \& S. M. Co.-An assessment of 50 ets. per share was levied. Jan. 14. payable at Office, cor. Sutton Apeque ars C St., Virginia City.
Baltimore America Consolidated.-Anassessment of 50 cents per share was levied, Jan. 5.
Savage-An assessment of $\$ 35$ cents per share was levied, Jan. 7.
Hawley.-An assessment of $\$ 1,00$ per share was levied Feb. 9, payable March 12.
Cole S. M. Co-An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.
United States M. Co.-An assessment of six and twothirds cts. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms is and 8, Government House, San Francisca.
Sierra Nevada S. M. Co. levied an assessiment of $\$ 15$ per share, Jan. 15-payable Feb. 18.
Lady Bryan.-An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.
Ida G. \& S. Co. (Russ District)-An assessment of $\$ 1$ was levied, Jan. 14.

## assessment bales.

Sales of Stock for non-payment of assessments are advertised to bo sold as follows:-
Oriental Tunnel Ca. will sell, on Saturday, Mar. 28.
Mars will institute proceedings against delinquents, Mar 16 th.
Planet will institute proceedings against delinquents Mar. 16th.

Moray Co. (V. City.-Suits for delinquent assessments will be commenced, March 14.
Michigan Co. (Gold Hill) will commence suits for delinquent assessmenis, March 16.
Lady Bryan G. \& S. M. Co.-Shares of delinquent stockholders will be sold at auction for assersments, at No. 400, Montgomery steet, on Jan. 27.

## general notices.

Yellow Jacket.-Corporate Deed now ready for signature at office of H. G. Maynard, Gold Hill, N. 'T.
Jenny Lind (Esmeralda.)-Owners of ground in this Cot are requestes to call and sign deed of trust at 608 Merchans St.
Mount Hope Co.-Persons claiming stock are reqrested to present title papers for examination till March 16.
U. S. Mining Co.-All persons claiming stock are requested to present title papers for examination at Nos. 7 \& 8 Government House.
Caution.-D. M. Tyrell warns persons against purchasing certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, standing in name of W. Williams. (See 'I'erritorial Enterprise.)
Ashland Co.-L. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ash land Co. is forbidden to extract any valuable metals.
Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

Tee Sweezy lCo., Gold Hill, give notice that Baltic

Company have wrongfuly claimed and worked their ground since July, 1860.
The Ghmaey Rock Co., lying next west of the Virginia Co. claims have notified the llazel Green, Tingley and Buach f paxton (ompanys that they are treesparsing upon the Chimney Rock Co's ground.

MINING AND SCLENTIFIC PRESS.
THE ONLY MINING, MECHANICL AND SCIENTIFIO PAPER ON THIS CONTINENT.
THIRD YEAR: VOLUSE V1, $\rightarrow$ NEW SERIES!
A new polume of thse extensively circulated paper commenced Sept. 11,
1862. It is intended that uvery number slall be replete with informnthan concerafig Minimy, सicientific, Meclumieal nud Iudustrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its colunins.
This puper is dovoted to the nbove purposen, togother with the interests that maty be of interest to the reader: abd it is the intention of the propindetor to spure no paine or expense in making it equat is interent and valuable information to any paper yet publisted.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stockr, new inveutions of Machinery to the siicer.

## The Inventor I

Will find it an excellent medium for the purpose of bringlag his foyention into notice, of ascertaining the progress of torention in this and other in obtaining his patent, the proprittor having had great experience as a Patent Agent, together with facilitics at Washingtou that enable bim to ob ain Patonts with dispatch.

## The Mechanic and Manufacturer !

Will be greatly benefitted by its perusal, as each number will contain reva eral orikinal engravings of new machinea and inventions, together with y
large amount of reading mattor appertaing thereto. Wo are constantle large amount of reading mattor appertainag thereto. We are constanto receiving the best scientific journals from all quarters, from which wr
shall continue to extract whatever may be of benefit or intorest to onshall cont
raders.

To Chemists, Architects, Millwrights and Farmers \&
This journal will be invalunble. All new discoveries in Chemistry will be given, and a large amount of information of great service to drehitects and Mived, and a wing be found in our columns. The Farmers and Planters will
Mol bo neglected, engravings will be given of agricultural implements, and not bo beglected, engravings will be given of agricultur
the farming interest generally will heamply discussed.

## Terms.

## To mall subscribers :-Four Dollars per annum

## Club ratos.

Five Copies for Six Months, $\$ 8$.
Ten Copies for Six Months, \$16.
Fifteen Copies for Twelve Months, 今44.
Twenty Copies for Twelve Months, $\$ 56$.
For all cinbs of Twenty and over, the yearly subscrintion is only $\$ 280$ Names cau be sent in at different times and from dimerent Post-ofices Specimen copies will be sent gratis to any part of the country.

## EWER \& SMIMH, Pablishers,

Room 27, (formerly) U. S Court Bnilding, Corner of Washingtrin and Be
tory strastn, sim Francisen.

THE MEXICAN METHOD OF AMALGAMATION.
BY JIMES NAPYER, JCN., F. C. S.

Late Chemist and Assayer to the Guabaxuato Mint, Mexico.

## coxclitied.

theory of the process.
Hativg now given a brief sketch of the mode in which the Mexican amalganation is carried out, I shall pass on to consider what chemical action takes place in this most interesting process. Before doing so, however, let us consider for a moment two terms- heat and cold, nsed in these papers.
Hect and Cold.-There are two kinds of heat : one is caused by there being add +d a superabundance of magistral; the other is induced by cold, and is called "calor de frive" These differ only in cause, the resuls in both cases being the destruction of mercury. If a hot torta be heated by artifcial heat, the chloride of mercury will act on the sulphide of silver in the same manner as the chloride of copper, forming chloride of silver and sulphide of mercary.
On cold mornings the tentaduras, or samples, often show signs of heat, in which case the action is called calor de frio -heat from cold; but, as the day adrances, and the sua begins to act on the torta, the effect passes off. In the winter season. a somewhat less quantity of magistral is necessary for carrying on the operation than in the summer months the amalgamators begin to decrease the quantities of mag istral aboat the beginning of September.
When a torta becomes hot from the use of a superabundance of material, a quantity of wood ashes or lime is added for the purpose of deconnposing the excess of bi-chloride of eopper to protochloride.
The terna cold simply implies that the operation is not going on so fast as it ought, and that a sufficient quantity of magistral has not beer added; if the torta be allowed to remain long in this state, a large quantity of mercury is apt to be lost in the form of oxide.
Theories of the process.-According to Sonneschmidt, the only theory which the Amalgamators had before his was, that the salt cleaned the silver, the magistral heated it. and that both reduced it to the metallic state so as to combine with the mercury. They were also aware that, for each ounce of silver produced there must be lost an equal weight of mercury ; but why this should be so, was a problem they could not solve, and all mercury lost beyond this they cousider mechanical.

Sonneschmidt's Theory--Sonneschmidt after many years of practice and careful experiment, published a most valuable treatise on the various methods practised in Mexico for the reduction of silver ores, and lays down for the patio amalgamation his theory, which may be briefly stated as fol-lows:-
The ingredients added to a torta, are salt, magistral (sulphate of copper,) mercury, and sulphide of silver. The salt and magistral act on each other, and form a bi-chloride of copper and sulphate of soda; the bi-chloride of copper next acts on the sulphide of silver, forming chloride of silver, which is dissolved in the excess of salt added; and the silver is next reduced to the metalic state by the mercury forming calomel and amalgam. This was Sonoeschmidt's theory, which to the present day is almost universally received as the true one. However, since his time it has been further shown, that the proto-chloride of copper, formed by the action of the sulphide of silver on the bi-chloride, is dissolved in the excess of common salt, and acts on another portion of the sulphide of silver, reducing it to the state of chloride to be acted on by the mercury, and be converted into amalgam. It has also been shown very satisfactorily by Rossingault, who has devoted some time to the subject, that the copper of the sulphate is ultimately converted into a sulphide by the following equation:-
Ag S plus 2 Cu Cl equals Ag Cl plus $\mathrm{Cu}_{2} \mathrm{Cl}$. then Ag S plos $\mathrm{Cu}_{2} \mathrm{Cl}$ equals Ag Cl plus $\mathrm{Cu}_{2} \mathrm{~S}$.
Sulphide of mercury is also at times found in tortas, and it has been supposed that this is formed by the calomel acting on the sulphide of mercury; but may it not be formed, as in
the arrastres, by the direct action of the mercury the arrastres, by the direct action of the mercury on the sulphide of sileve? Some amalgamaiors suppose that the cop-
per is ultimately converted into uxychloride. per is ultimately converted into uxychloride.
Bouring's Theory.-Iu 1848, Mr. John Bowring, who has
had much practice in the patio amalgamation, as carried on in Mexico and Peru, read a paper before the British Association, in which le denied that chloride of silver was forined at all in the process. His principal reason was founded upon experiments made in Guadaiupe-y-Cnlvo, in Mexico, where he states, chlo ide of silver conld not be found even
after learing the tortas in the patio in working order for the after learing the tortas in the patio in working order for the space of four monthe. In 1858, Mr. Bowring also published a pamphletiu Mexico defending the same idea; and de-
scribing, as he likewise did in the theory, the basis of which I translate from his pamphlet:"It is," he writes, "well known, that the materials which are employed in the reduction of the sulphides of silver, consist of salt, sulphate of copper, aud mercury; and that, by place. I mixed the three in an appropriate vessel, and found that the mercury combined with half of the chlorine contained in the bi-chloride of copper, and thus formed a proto-chloride of both metals. This combination of the lat ter metal-copper-has the property of absorbing oxygen hence, we may suppose, that this element is the principal agent in the operation. I made some proto chloride of copper, tried it in the patio, and obtained a good result.
"According to the theory which this mode of treatment establishes, the bi-chloride of copper gives an atom of its chlorine to the mercury, and both metals are converted inte proto-chlorides; the chloride of copper absorbes oxygen, which combines with the sulphur of the silver, forming sulphuric acid, and leaves the silver in a metallic state to amalga-
mate. mate.
"The sulpharic acid formed by the sulphar of the silver end the oxygen of the proto-ehloride of copper, decomposes the common salt, and the chlorine disengaged in this way coubine in either of the two following methods:-1st. With the protrochloride to form again a bi-chluride. 2nd. With the chloride of the protoxide of copper, which, absorbing another equivalent of oxygen. passes to the state of oxychloride, or chloride of the perwide. According to my
mode of thinking, the protochloride of copper produces in the benefficio (amalgamation) an effect analogous to nitrous acid in the manufacture of sulphuric acid. It is easy to imagine that the protochloride of copper, aiter it has absorbed oxygen from the air and water, and given it up to the sul
phur, will return to repeat the sameoperation." phur, will return to repeat the sameoperation."
Mr. Bowring then gives the following proofs of his the-
ory:-ory:-
"I. Dissolve, in a glass or porcelain vessel, salt and a small quantity of sulphate of copper, with this mix some mercury, and at the end of a few hours there will result a white powder which is protochloride of mercury: filter the solution, and precipitate the copper with caustic soda or potash. The orange colour indicates a salt of the prot-oxder, it will, in contact with gather on a filter the white powder, it will, in contact with caustic soda and amonia, be converted into the prot-oxide of mercary, which may be known
from the black colonr it assumes. It the from the black colour it assumes. If the solution of pro-to-chloride of copper be left exposed to the air for a longer time, there will form on the surface a yellowish gree crast, which is a chloride of the prot-oxide of copper.
"II. Beneficiate (a)
'II. Beneficiate (amalgamate) a small quantity of ore, containing sulphide of silver, with salt, and bi chloride of copper chemically pure; at the conclusion of the operation add distilled water; filter, and precipitate the solution with nitrate of baryta; when it will be found, that there has been a formation of sulphurie acid equivalent to the sulphur which was combined with the silver. It is to be noted that presence of acid could not have been formed without the presence of oxygen, which, without doubt, resulted from the absorption of this gas by the proto-chloride of coppcr.
"III Amalgamate silver ore with bichromate of potash these two latter on each other is to evolve oxymen) action of will be found that there is formed an amalgam of silver. In the same way, any materials which produce oxygen may
serve in the amalgamation. serve in the amalgamation.
"IV. Take the amalgam of a tentadura (sample) of a torta which is in good working order, that is in such a condition that when the amalgam is pressed with the finger it aud alterwards with distilled water, when it waill be found that the white powder which remains is a protorbloride
states: "The difficulty there is in working ores containi
chloride of silver (like those from the district of Catora demonstrates clearly the nunfoundation of the formation
district of Cator chloride of silver in the common patio amalgamation Thus, we have. Mr. Bowring's reasou for rejecting the the ry of Sonneschmidt, and denying that chloride of silver
formed, and also the theory of his own which he propos to substitute.

Uslar's Experiments.-In 18533, Dr. Uslar pablished pamphlet in Mexico, comparing the patio with the bare amalgamation, in which he, like Mr. Bowring, denies ths chloride of silver is formed in the patio. He argues, the
if the silver were converted into chloride, some other me the silver were converted into chloride, some other me
al, such as copper, might be substituted for the mercury til the whole of the silver was reduced to the metallic stat and he instituted experiments to prove that such would no answer. Thus he introduced into a torta a superabundanc of materials-salt aod sulphate of copper, and some meta lic copper. The result obtained was, no silver reduced, ani
the conversion of the greater part of the metall copper into chloride. The next experiments were mae with a view of protecting the mercury by copper or iron The results were:-where iron was used, there was no ame gamation at all, the mercury coming out as it went in, with out amalgam; but, where copper was present, the re was diflerent, the amalgam containing a large quantity copper with but little silver. The conclusion drawn by
Uslar from the above other metals is against the amalgamation.
In a third series of experiments, there was put into the torta double the usual quantity of sait; in two days afterward the magistral was added, and the whole trodden at innassals during fifteen days. Then iron was added, and the mass again trodden ; and two days after this the mercury was added ; but the torta, showed no symptoms of entering the patio, and being trodden daily, the mercury was tase
that and out as it was put in, without amalgam. Hence, Dr. Uslay comes to the conclusion that it is not true that chloride of silver is formed by the salt and sulphate of copper, and re duced by the mercury; because, with the extra quantity materials, chloride of silver ought to have been formed, the iron ought to have reduced it more rapidly than the mer cury, and amalgam ought to have been formed ; but nothing. of the kind took place. He also argues, that as ores, corn: taininig native chloride of silver; cannot be worked by the patio amalgamation, it therefore conuot be formed by it
However, Dr. Uslar, anlike Mr. Bowring, proposes no nep Howeve
theory.

Consideration of the Theories.-Having now stated the varous opinions generally entertained regarding the theory of this process, I shall venture a fery remarks which mas oot prove altogether uninterestiog, and may help to throw some further light on the sublject. An apparently very strong argument used by Bowring and Uslar againsi chloride of silver being formed in the patio amalgamation is, that native chloride of silver, according to them, cannol be worked by that process. This might even be quite true and yet chloride of silver be formed in the process; for w6 ave only to consider the physical properties of the nativy hard horny substance, which, even in amuonia-probabi) its best solvent-will take some time to dissolve. Now, ir a torta, the solution of salt is comparatively weak ; it is al so cold, and will dissolve but a very small portion of the newly-formed chloride; but of native chloride (or horn silver,) I question much whether the usual strength of salt in a torta would be strong enough to dissolve any. Edward Lou kner* has ofter assured me that horn silve can be reduced very well, in fact, better than any other com pound, in the patio, providing that great care be taken il the grinding, so as to have it in the smalest possible state o dirision, and that an excess of salt be added in the opera
tion.
Another argument used by Dr. Uslar, to prove that chlo ride of silver is not formed in a torta is, that if such were the case, it ought to be precipitated or reduced by anothe cury.

Now, metalije silver can be produced from the sulphide b: varions methorls; but there is a great difference in the casi

Avinher Dividendepaying Menimo Company．－The Im－ peri 1 silver Miniag Compasy have just dectared a first monthly dividenil of 11,2 per cent．on $\$ 1.01000000$ ，the amount of capital stuck issued．This company was recent－ ly incorporated in this city，and consists of a number of mines and mills at and neur ciold Hill，N．＇T．，tho various parties representing which have united their interests． Among the consulidated concerns is the Washoe Gold and Silver Company No．1，well known in this city as the pio－ veer company in the nill enterprize of Nevada＇Ierritory．

Lady Bryas．－This stock has been more largely dealt in io this city，the past week than any other in the market．It commenced at $\$ 7$ and has been gradually advancing until coday it has reached $\$ 25$ ，with a still upward tendency．－ The cause of this rnovement is attributable to a rich strike at the mine，disclosing rock strongly resembling the Ophir A quantity of this rock has been received in the city，and may be seen at No． 40 ，Montgomery Bluck．Somo san－ guine holders are looking for very high figures at an ear－ ly day．

Fridar Evishing，March 20th
The day has been disagreeably sto rmy ；yet the stock market has been comparatively lively．Potosi has not recedel th the prices anticiputed yes－ terday．Operators in Sau Fraucisen are not disposod to go into much of a panic on mere rumor．Tbey are awating the decision．Telegrams an－ pounce that it is still held at $\$ 425$（3） 450 ．Fairview is advancing，and is saleable at $\$ 36$ ．Thirty feet sold to day at these dgures．Bultion is in ro－ quest aa $\$ 40$ ，and is marketablo nt 45 ．Fift $\Omega$ feet sold at $\$ 40$ ，and thirty at 875．The Princess，at Gold Hill，is in demurd at，$\$ 10$（1）50，and might be sold，probably，if in market，al $\$ 60$ ．The Bloomiugdale has been in re－ quest to－day at $\$ 5$ © 7 ．Sisty feu t हold at an average of $\$ 6$ ．The El Dora－ do is held firmly at $\$ 75$（a） 80 ，with lifte in markot．Ten feet sole to－day at \＄75．Beach \＆Puxton is marketable at an advance on our Jast quotations， Birdsall is quuted at $\$ 40$ ，at which ligures 18 feet sold to－day．Eureka， Gold Hill，is saleable at $\$ 30$＠ 35 ，with lit＊le in market．Zouave is quoted at $\$ 21$＠ 22 ，with a fair demaud．The Insurance，west of the Beach \＆ Paxtou，is salcable at ${ }^{3} 5$＠6．Shamrock is rather on the decline．Wo
quote it at $\$ 15$＠ 20 ．The following sales are reportod by Platt \＆Low，of Gold Hill： 6 feet Gold Hill G．\＆s．M．Co．No．I，（uow called the Alpha），at $\$ 400$ per foot． 6 feet Gold Hill G．and s．M．Co．No．2，at $\$ 00$ per toot． 20 feat Overman，at $\$ 30$ ； 10 fuot Overman at $\$ 35$ ．

Saturday Eveateg，March 14， 1863.
The business of this day has been rather light，athough u number of hea－ vy transuelions are reported．Fairview hay beeu in high request． 100 feet suld at $\$ 40$ ，and $\$ 50$ is now offered．Bloomingdale has been dealt in largely to－day．About 200 feet have changed hands at from $\$ 4$ to 7 ．The compeny
is about penetrating its ledge at a depth of about 250 feet from the surfuce． $\$ 10$ is freely offered without takers．The Pride of Washoe is marbetable at $\$ 30 ; 32$ feet suld to－day at that figure．Ashland is again meeting with re－ quest and mav bo quoted at $\$ 10$ to 12 ，witl an upward tenduncy．The san－ tut Rita is aduancing and is now held at $\$ 35$ to 60 ．Very fine ore is being ex－ hibuted from the mine．It is extremoly gratifying to observe such eviden－
ces of value iu the ledges back of Virgiuia，The Branch Mint at Gold Hill， ces of value in the ledges back or Virgiuia，Se Branch hiat al Gold am， low the surfuce．Tha Bolcher is still advancillg．It comot be quoted at lens than $\$ 100$（3）125．Tho Princose，in litigation with the Yellow Jucket， is sought for at $\$ 45$＠ $50 ; 17$ feot sold to day at $\$ 50$ ．Bullion is saleable at $\$ 40$＠ 45 ； 35 teet sold at 4250 ．

## ESMELEALDA STOCK LIST

## LIST OF MINING COMPANIES HAVING OFFICES IN SAN FRANCISCO.

By reference to our advertising columns it will be seen that Arzzona and Sonora.-Roman \& Oo., booksellers, on the opposition steamer, Moses Taylor will leave for the Fast Montgomery street, have laid upon our table an octavo on the 22d of April. The price of passage will be greatly pamphlet of 124 pages entiled "The Geography and Rereduced, thus affording another excellent opportunity of sources of Arizona and Sonora." The work comprises an going to the Atlantic States for a mere trifle.

Change of Steamer Days.-By a notice in another columu it will be seen that the steamers of the Pacific Mail Steamship Company will hereafter be dispached on the $3 \mathrm{~d}, 13$ th and 23d of each month. When any of these fall on Sunday, the steamer will be dispatched on the following Monday.

Mr. Mowry is intimately acquainted with the country, and has collected in the page before us a large amount of seasonable as well as valuable information.
Mining Dividend.-The Gould \& Curry company declared a monthly dividend, on Friday last, of $\$ 100$ per foot -making a total of $\$ 120,000$, as the yield of that mine for the past month.
Jewel Company.-This company, located in Spring Valley, Washoe, and incorporated in this city, has recently struck very excellent ore in their mine, 90 feet below the sur face. Thirty tons of the rock is about to be crushed at a trip from the North.

## Amalgamating and Separating Pans,

It is acknowledged by all who have examined the prin ciples and witnessed the operation of these Pans, that they are decidedly superior for tritur
mating purposes to any other in use.
The most important principle connected with the ope-
ration of these Pans is the senaration of ration of these Pans is the separation of the trituratiog
process from thet of exrractiog the amalgam from the saud. The chiet cause of loss of che preciour metals arises from the passing off of the same in combination with
the quicksilver, during the proces of trituration, and i
eleaning up. By the introduction of the Separating pan cleaning up. By the introduction of the Separating Pan
to frllow the trituration this lose is entirely avoided. In working these machines there is no appreciable loss
quicksilyer, and hesce none of the precious metals. quicksilyer, and hesce none of the preciots metals. by tho side of others on sauds from the same vat, the
Wheeler Paus have uniformiy gained a large percenta Wheeler Paus have uniformily gained a large percentage

IORE ABOUT THE "KEITH PROCESS" FOR DESUL PHURIZING ORES.

In a late issue of the Press we gare some account of a new prucess, fur calcining or desulphurizing ores; with a romise to report further upon the matter whenever anyhing new came to hand. This process has been introduced at Blackhawk in the P'ke's P'eak mines and is known as the Keitr process. We quute, as before, from the letter of a correspundent of the Territorial Enterprise:-
"The process is a more sensible plan of working than any saw in the country. It may not be all its owners claim or it, but it is a move in the right direction, and with suck mpprovements as may from time to time be suggested, will
ventually be the mude used throughout the Colonado mines. As this process differs in some respects from those in use in Washoe, it will doultless be interestiug to our millmen to foad a description of it. The ores of the country contain a ery large amuunt of sulphur, and this has been a source of
reat trouble to nillmen. It is apt to combine with the reat trouble to nillmen. It is apt to combine with the o granulale. This effect is more readily produced when virm water is used in the batteries, therefore only cold ater is used. Some attempts were made a year or two ago o desulphurize the ores, but without much success.
hat the sulphur connot as easily be burbed out of their ores s out of our own, but the mode of operation was defective.
'hey attempted to burn the sulphur out of the lumps of re just as they came from the mine. This they tried to do y piling it up in kilna, built exactly like lime-kilns, an urning it as lime is burned. 'I his only glazed the ore he outside and melted the sulphur without dissipating it. On breaking open lumps of the ore, streaks of melted sul-
har could be seen through the mass. Until lately no one hought of firsteru-hing and then burning the ore as heans of getting rid of the sulphur. I do not doubt but the everberatory furnaces used in some of our Washoe reducion works would effectually desulphurize any of the Pike peak ores. But Keiths pan differs greatiy from ours, and ary be much better and cheaper. I don't know that a
ritten description can be understood, but I will make it as lain as possible. In describing the desulphurizing apparaus it will also be necessary to mention a new grinding mill, alled by its inventor the 'Young America.' The reader rat to imagine a mill built (as they generally are in
Vashoe) with one floor some eight or ten feet above th Vashoe) with one floor some eight or ten feet above the
ther. On the upper floor stands a masticator (the same as hose used on the Pacific const, which breaks the ore into mall piecea. The pieces pass from the masticator into the lopper of the 'Young Aruerica' mill. Now for said mill :-
The mill is simply a hollow drum or wheel of cast iron about wo feet and a half in diameter and six incles thick, setting ip edgetwise as a common griadstone stands when hung. Bu his is not hugg and does not revolve, but is securely fastened n a frame. The crushing machinery is inside of the circular
hell, and consists of nothing more than a number of fan shap hell, and consists of nothing more than a number of fan shap-
d arms which revolve with very great velocity. These arnspre slightly curved and toward their points widen out till hey are nearly as wide as the shell within which they revolve. That is all there is of the mill, velocity does the rest. The fans revolve with such tremenduus velociry that all the pre coming into it is knocked iuto an impalpable powder The immease velocity of these faus surprises the attraction f cohpsion in the pauticles of ore, and they instantly sur cender in the shape of the finest dust. Now, when I com
to tell how the dust gets out of the mill I approach the de sulphurizing apparatus. The fans of the mill, revolviog as have deseribed them, of course, create a strong blast, lik the blower of a foundry. This carries out the ore as fast as
and up a sheetiron tube about six inches in diameter (common stove-pipe,) to the furnace, some eight feet higher than the mill.

Tt:e furnace is a square brek structure, with a grate about three feet wide by four in length, and three feet high, in which a fire of common pine wood is bailt. The flame from this fire-place escapes into a chimney built in the shape a muffe and, instead of rising upward, runs down toward he lower floors at an angle of torty-five degrees. The tube from the mill enters this muffle-shaped ch miney at its upper end, just where the blaze from the furnace enters, and the strong current of air forced down it carries the flame through its whole length It is claimed that much of the air forced nto the chimney is comsumed, as also all the sulphur contained in the ore, which in burning greatly intensifies the heat. There are several round holes, un inch or two in diameter, at intervals of three or four feet along both sides of the chimney. Througl these, when the apparatus is in oppration, a further supply of air than that furnished by the blower, is sucked in and assists in decomposing the sulphur contained in the ore. By the machinery above decribed, ore may be more quickly and perfectly burned than by any other plan I have ever seen.
In passing down the flue, or chimney, the pulverized ore is
blown as dust through a jet of flame for a distance of abour
twenty feet-the length of the flue-and each particle being
separate, is surrounded hy air and a strong flame-in fact, is itself a red hot, blazing spark, with nothing resting upon it or confining it. 1 t is in itself a miniature meteor, with plenty of room in which to give off its sulphur, arsenic and oth-
er volatile constituents. After pasi $g$ down the flue, it falls
into a receptacle of brick-work, whence it is raked out upon an earthern floor to cool. The ore now presents about the same appearance as that burned in a reverberatory furnace - a brick red. The amalgamating machinery is simply an arrastra about eight feet in diameter, with a stone bottow
and drag-stones. The sides or rim of this arastra is of copand drag-stones. The sides or rim of this arastra is of cop per plate.
Mr Keith claims that with this machinery he can extract one thousand dollars per cord from rock which heretolore, by the old peocess, has only yielded two hundred and
fify dollars per cord. The expense will be one handred dollars per cord, leaving nine handred dollars clear. [ 1 cord of ore as measured in Pike's Prak, varies from 5 to 8 tons, according as the same may be heavy or light.] One-third of a cord of ore was tested by this new process, during my stay in Central City, and yielded at the rate of about eight hundred dollars per ton, where the old yield was thirty one dollars and twenty-five cents per ton. This was a most satisractory result when we consider that it was the first attempt with the new apparatus. The mill men of Colorado have been sluicing twice as much gold into the ravines as they have saved. They have loog known this, but they were Noll poor and afraid to venture upon any kind of experiments. Not a single man of cup'tal bas ever attempted the reduc-
tion of the ores of this country. All who have engaaed in tion of the ores of this country. All who have engaaed in
the business have been men of small means. Some of these have now become wealthy and are just beginning to think of mproved machinery and processes.
There is much of novelty and perhaps of value, both in the crashing and desulphurizing process, as described above, The rednction apparatus, spoken of as the "Young Amer ica" mill is constructed much after the manuer of Pond's crusler, which was illustrated in our issue of March 16 th, and almost precisely like the "smut mills" used in the wheat growing states, at the East. The process for desulphurization is certainly very ingenious and quite new. If it will accomplish a tithe of what its projectors claim, it must prove of great value. The results given, as yet, appear to
practical use it must, and will soon find its way into general use. We shall carefully watch for further results, and shall lay them before our readers as soon as obtained. The objections, spoken of in our first notice of this process, wre not yet entirely removed from our mind. We trust, however, for the success of the general interest of quartz mining, that this process may accomplish all that is claimed for it.

## THE MINERALOGY OF THE OVERLAND ROUTE.

We have heretofore given several interesting extracts from letters written by "Dan de Quille," to the Territorial Enterprise, during his late trip by the Overland stage-coach to the East. We now copy the following from his latest published letter :-

The country shows nothing but sedimentary rocks from the Webber to the Black Hills. Coal is found cropping cut on Green river, on Bitter Creek, and in sevtral other places on the route. On the Yeliow Creek hills, which we get into soon after leaving Echo Cañon, we found our road obliterated by the snow having drifted over it, but we had a strong team of six mules, and passed over the range without difficalty or delay. The Bitter Creek country is the most barren, bleak and dreary on the whole route. It is really a bitter looking region, und bitter must be the lot of those whose fate it is to keep the stations of the Overland Company in this dessolate place.
A ceas orl might be had here with very little trouble. It drips out of the rocks in one place along a ravine. At one of the stations they told me that they sometinies dug out this rock and used it for fuel. They supposed it to be some kind of coal. yet were puzzled to know what to make of the stuff, as it was not the color of coal and presented much the appearance of any other shelly rock. It was in no wise reduced in balk by burning, and after the grease stopped stewing out of it, it would go out entirely.' "Their coal was simply slaty rock completely saturated with coal oil. Were this in Nevada Territ ry or California, it would be a fortupe worth securing, and it may be of value, situated as it is, in Bitter Creek Valley.

Silver Indications.-We passed through the greater part of the Black Hills in the night, and had little chance of examining their formation; but when we first entered them I noticed several quartz veins crossing the road. These had more the appearance of being silver-bearing than aurifenous, and resembled some of the ores of Palmyra District, Nevada. Territory. Judging by what I saw of the country, I should say that paying mines exist in these mountains, at least on their western slope.
'The Norte Pacific Revient for April has been laid on ar table, and contains a variety of attractive reading mat-

The present number is embellished with a spirited and lile like lithograph of Gen. Joseph Hooker. Mr. W. Warrin, Esq., retires from the editorial chair, and the Magazine will hereafter be conducted by Messrs. Dalgliesh \& Co.

The California Nautical Magazine for April has a good table of contents, chiefly adapted to its own peouliar sphere.

Another Monster Dinmonn.-Late Havre papers speak of a diamond recently found by a negro in Brazil, far exceeding in dimensions the famous Koh-i-noor: They say that Sambo intends to appropriate the preceeds, to the eso tablishment of a settlement for free blacks.

GOLD MINING IN WALES, (ENG.)-NEW MINING MA-
CHINERY.
The returns of the British mines for 1861 contain the first actual report of gold produced from a mine in England. This gold was taken from a quartz lode in Dollelly, Mirionethshire. The natural consequence of this discovery was the formation of numerous companies to work other lodes of a similar character in North Wales, in the progress of which considerable interest is felt among British mining circles.

We learn by a paragraph in the London Mining Journal of Jau. 20th, that these companies have met with similar troubles with regard to the saving of the mineral which was, and still is encountered by the gold miners of California. A correspondent of the Journal says that "Several modes of extraction have have been experimented upon, and have generally, if not totally failed. The lastattempt was to be perfect; there was to be no mistuke alout it; but the result of that, again, was that about 17 ounces of gold, per ton, was extracted fron the tailings." Here, we appear to have the early days of Califorvia repeated in the ancient mining region of Wales. At present, it is said that but two gold mines, there, are makiog regular returns. Quite a discussion has also been goiug on as to the relative merits of the ordinary Stamps and "Berdau's Ceusher," for reducing the rock. Berdan's machine seens to have the inside track. In alluding to different operators, the correspondent of the Journal says :-
"John Perry has an average yield of about 7 ozs. of gold per ton from the Vigra and Clagan; and old Owen Evans gets a constant yield of 4 to 5 ozs. per ton in the Welsh Gold Mining Co's mine, at Ceincech. The last named person is a most unassuming man, but he has given years of study and nights of anxiety to the gold question, and he firmly believés he has mastered it,
From want of the aid which a really practical worker could render, most suhstaritial buildings have been erected, water-wheels and steam engines ditto, stamps and crushers attached, amalganating machines, in barrels, pans, troughs, etc., and a rivulet of mercury has run to waste, in fruitless attempts to catch the gold; mea as able and as keen as the late Sir Robert Peel, have had to do with these works as shareholders and managers, they have brought to bear upon the subject a vast amount of skill, experience, industry and capital. Their only failure was, they did not, as we may say, "chalk their boblins."
There is another veteran in the gold business in Dolgelly ; I allude to Robert M. Roberts, who was connected with the late Mr. Harvey in all his gold researches. The person I have named will tell you that in the Merionethshire quartz, there is a substance difficult to overcome at first, and the presence of that substance is the cause of a large amount of failures. To overcome it is as easy as to 'chalk your bobbins.' They have overcome it, and have extracted gold from all quartz in which it was contained If any director, shareholder or manager of gold mines should be enibarrassed, or wish instruction, I would recommend to consult Perry, Evans or Roberts on the sulyject of guld quartz. I am glad to say they are called upon sometimes to give an opinion. In Dolgelly these opinions are safe to follow. It is not the purpose of this communication to ignore any of the efforts of the eminent men, geatlemen of very great attainments, who are engaged in solving the problem of extracting gold, profitably, in Wales."
An old Californian, well known as a former resident of this city, and onec extensively engaged in mining enterprises on this coast, is also operating largely among the new found English gold mines. He is noticed as follows, in the same communication from which we make the above extracts :-
"I would also add that Mr. Moshetmer has the charge of erecting an extensive series of machinery in three or four different mines: I have seen the castings of 'Mosheimer's Patent,' and from the well known ingenuity and experience
of this gentleman, down to 'chalk your bobbins,' I frinly believe he will overcome every obstacle, and that his reductionworks will be an honor to himself, and a profit to his friends."

From the last paragraph it will be observed that Mr. Mosheimer has devised a new class of machinery for the reduction of quartz and the extraction of the mineral therefrom. From letters received in this city, we understand that Mr. M. crushes the quartz dry; that he has secured letters patent for the same in Evgland, and taken the necessary steps to do the same in this country. We shall proba bly soon be able to give an illustrated description of this machinery in the Mining and Scientific Press.

Coat, has been discovered about 70 miles east of Star city, Humboldt, and parties are now engaged in examining the locality, with the view of learning its capacity and value as a fuel and practicability for working.

INVESTMENTS IN THE INTERIOR.---HOPEFUL PROSPECTS.
It is a significant and most important fact that an excess of about $\$ 10,000,000 \mathrm{in}$ coin has been sent into the interior over, and above cuin remittances from that direction during the past year. The necessary deductions from this fact are that this balance has been absorbed, within the period referred to in the operations of internal commerce, in the expansion of agriculture, the opening and working of the mines, the building up of manufacturing establishments, and such olher uses as are incident to the thrift and enterprise of an industrious and prosperous people.
The rapidly increasing area of our mineral developments, and the new and improved methods now being introduced for the reduction of ores and the extraction of minerals therefrom, together with the rapid formation of new companies for prospecting and working, imparts to this leading interest of industry a degree of excitement and energy rare ly witnessed in any industrial pursuit.
With the incoming of the year we have witnessed the springing up of an eutirely new branch of miaing industry, and one which bids fair to rival in extent and importance either silver or gold. The existence of a copper belt inex haustalle in its yie'ds, and extending throughont the entire length of the State, is now a universally acknowledged fact. The bearing which this new development is destined to exert upon the future growth and prosperity of the Siate is, just now, a theme of most hopeful and animated discussion
The copious rains, with which we have recently been visited, have set to rest all apprehensions with regard to short crops in our agricultural districts, while the large accumulatinos of snow upos the mountains assure the miner that his summer supply of water will be fully equal to the ordinary amount. The failure of the usual supply of water to the miner, in the early part of the seasou has been more than compensated, in the increased facility such lack of rain has given to prospectors and operators in auriferous quartz and copper. With the success of all other branches of industry our mercantile classes have the fullest assurance of an abundant demand for every description of merchandise suit able to the California trade.

A Weathet Propher.-George Shepherd, Civil Engineer is furnishing the London Mining Journal, with weekly pre dictions of the state of the reather, etc. founded on philosophical and scientific calculations, which are attracting considerable attention. In his letter of Jan. 20, 1863, he says :
"I regret that my absence from London on professional business, prevented me from foretelling the approach of the late severc gales, which caused such havoc on our coasts.
With regard to looming events; strong winds will occur about the 28 th inst., also about Feb. 3d. I have already foretold we shall have an early spring ; we shall also have a fine summer and autumn, and weather all that could be desired for the next harvest. But the year 1864, I again repeat, will bring sorrow, perplexity and trouble on the English nation generally. [Perhaps the prophet sees "English Intervention," in American affairs coming up in the early fu-ture-Ed. Press.] There cannot be a doubt but that our winters are gradually improving. How long it will continue to be so we must leave to the wise Dispenser of all things. To all appearances another comet is approaching the sun, and will be discovered very shortly. This, however, I leave to our astronomers, who have more time to search the beavens than I have. I wish I had more leisure for this inter esting subject."

How to Tell tae Valoe of Greenbacks.-Many persons find it difficult to compute the value of paper money when gold commands a premium. A simple and invariable rule to arrive at the value of paper money when gold commands a certain premium is to multiply $\mathbf{I} 00$ by the amount of the premium on grld and divide the product by 100 with the amount of preminm added; the result shows the exact amount of the discount on paper money. For example : Say gold is quoted at 60 cents premium in New York; multiply 100 by 60 and the product is 6,000 ; divide this by 160 and the result is $371 / 2$, which is the exact discount on the paper money, and shows that when gold commands a premium of 60 cents on the dollar paper money is werth $621 / 2$ cents on the dollar.

From Humboidt.-We received a call, on Saturday, from William Holcomb, Esq., of Humboldt, N. T. Mr. H. left upon our table specimens from several of the principal leads
in the Buena Vista. District; among them we notice the Schuylkill, Sargent, Camelion, Comet Cornex, and Mars, The furmer is an exceediugly rich lode, and the speci man before us, which has been subjected to the action of fire is completly coated with silver, that has been brought out by the heat. The claims ahove enumerated are all consider-
ed very valuable, and measures are being taken to have ed very valuable, and measures are being taken to have them thoroughly developed. 'The specimens' before us are unlike those usually found abont Virginia City. They conist, so far as we can judge by the eye, chi efly of Horn Silver, which is usually considered very valuable as a silver ore, and is easily worked. They preseut the usual shades of this ore from green to a yellowish brown and dark blue, and are evidently very rich. We notice very little appearance of sulphurets, except in one from the "magna charta," lead in Santa Clara District. These specimens may now bo seen ut W. P. Denckla \& (Yo., No. 508 Montgomery
Mining in Austria.-The Austrian Government is among the most liberal of the Eur pean Powers, in its of couragement of mining enterprise. The country possesses a large variety of minerals, from gold and the other precious metals, down (or rather up) to iron, and coal, Large numbers of foreigners, (especially Englishmen) aro engaged in mining in that counıry, and extensive developments have already been made; yet there is a vast extout of mining territory still undeveloped. The Governmeat gives to those desirous to engage in mining, important facil ities, and "concessions" or permits to mine, cost but a trifle compared to similar requirements in other European countries. In England, a man who desires to embark iu gole
mining, must first fay down a fee of about $\$ 25$, and then pay over to the Government one twelfth of all the gold produced. This rule, we believe, also holds good in minirgig for other minerals. In Austria, a man pays $\$ 5$ for hif "concession," and but one fifth of the net, instead of the gross produce, as in England.

## dinimg and Scientific 3 ress:

The MNING AND SCIENTIFIC PREAS is publishod at the Exchang Building, Room 27, corner of Battery and Washungton streets san Fran.
cisco, Cal., at FiFTY Censs per mouth, wr $\$ 4$ yer aunum, in advanco. C. W. M. SMITE and W. B. EWER,

## To Printers.

An Intereat in one of the moat flourislaug aud best paying Newn per offices in the mountains is offered for sale on easy termos, 4 rare portunity is hereby presented to any priuter desirous of eitablishing self in a good business in oue of the bealthiest, most thriving and de ful mo
office.

SUuscorribs,-Are you a miner and not a subscriber to id Mintig and Sclevtrifi Press? If so, you are an annu loser of many times the price of of year's subseription, pu tieclarly if you are engaged in qnartz mining. The sid amount of practical information, important to miners mechanics, which is contaiued in a volume of the Press, not be bought from the shelves of any bookstore in the cou try for the price of several year's subscription. Do you en send a paper to the "Old Folks at Home?" If so, and y desire to send important information aud valuable reasi matter, you can find no paper that will be read with so eagerness by them, or one that will convey to them
an account of the real industry of the country 2 s the
 names and four dolumsts, or thoo dollar: for six months, become patrons of the only mining paper printed on the $\mathcal{F}$ cific coast. Those who reeeive a paper with this paragra
narked may understand that $t$ is sent to them for ex marked may understand that it is sent to them for exani
tion, and with the hope that it may so for meet with th. tion, and with the hope that it may sofor meet with approvil as to warraunt their subscosibing for it on once. 1
 the paper where it is not now known, we will, for thept ent, send the Parss for three months even, on the recelpt one dollar, in coin or stamps. It is our belief that no will wish to diseontue the paper after being a coostant re
er of it for even that short perioo.

# SAN FRANCISCO MINING NOTICES. 

ASSESSMESTS LEVIED.
Assessments upon Mining stocks have been levied as fol-low's:-
Garabaldi-Assessment of \$1 per share, levied March end.
Sutro.-Assessment of \$1 per share, levied Feb. 23, pay-
0 March 23.
Silver Quartz Mill Co.-Assessment of 5 per cent. levied Fob. 23, payable Murch 28 .
Helvetia.-Assessment of 25 cts. per share, levied Feb. 7, payable March 10.
Zouave.-Assessment of $\$ 1$ levied Feb. 22, payable Mar.
Rogers.-Assessment of $\$ 5$ per share levied Feb. 4, paypable Mar. 15.
Sum Wright.-Assesment of 50 cts. per share levied Mar, payahie immediately, delinquen's to be suld A pr. 2.
Nupuleon (copper.) - Assessments of $\$ 3$ per share levied Mar. 3. payable iu 30 days.
Golinn Are-Assessment of one dollar per share levied -eb. 24, payable March 26.
Washoe trold \& Silver.-An assessment of 2 per cent.
n capital stock whas lovied Feb. 16, payable Apr. 1.
Rhodes' Diggings.-Assessment of 25 cts . per share lev-
ed Feb. 2G, payable Mar. $\overline{\text { J. }}$
Texas Co., at a Meeting held Feh. 14, levied an assessnent of ous lollar per slare, payable to the Secretary in Virginia City.
Santa Rusa Co.-February assessment of 20 cents per share now due and payable.
Madison Co.-An assessment, two dollars per share, was pevied Feb. 17, payable immediately, at Office, 600 Mer hant St.
Cuion Co.-An assessment of one dollar per share was levied February 16, payable on or before March 25.
Peua Co.-An assessment of $\$ 3$ per share was levied Feb. $\overline{5}$, one half payahle March 1, balance A pril 15.
Kossuth Co., Devil's Gate District.-An assessment of 10 ts. per share was levied Feb. 7.
Constitution Company levied an assessment of 25 cts. per
Peb. 11, payable immediately.
La Pla'a Oro Co. levied an assessment of five dollars per hare, Feb. 9, payable at Office of the Secretary in Virginia City.
La Plata Co. levied an assesment of 50 cts . per share Feb. 2ud, payable at Office of the President.
Alamo Co. levied an assessment of 50 cts. per share, Feb. 11, payable on or before March 20, at 115 Cul. Street San Francisco, or at office in Carson City.
Tucker Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.
Hawley Co. levied an assessment of one dollar per share, on Feb. 9, payable on or before March 12, to Superintendant at the mine, or Secretary at Office.
Slate Range Co . levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.
Moss G. \& S. M. Co.-An assessment of 50 cents per hare was levied Jan. 27, payable at 428, Montgomery St., pr to the Superintendent at the mine.
White Cloud G. \& S. M. Co. levied an assessment of 5 cents per share, Jan. 27, payable to the Secretary, at 128. Montgomery $\mathrm{J} t$.

El Dorado G. \& S. M. Co.-An assessment of One Dolor per share was levied Jan. 23, payable to the Sec. or to he Supt.
Gaudaloupe S. M. Co.-An assessment af $\$ 30$ per share
Fas levied, payable on or before March lst.
El Tesora Mining Co.-An assessment of $\$ 11 / 2$ was levied Jan. 27, payable at office on or befora Feb. 27.

Polar Star G. \& S. M. Co. levied an assessment f 50 cents per share, February 4th, payable on or before the 4th of March, at the Uffice in this city or to the Superintendent at the mine in Aurora, (Esmeralda.)
Dios Padre G. \& S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, alsu an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. \& S. Mining Co.-An assessment of 25 cents per share was levied Jan. 24, payable immediately.

Sonora Mining Co,-An assessment of 25 cents per share was levied,Jan 23, payable imnediately.

Overman Mining Co.-25 cents per foot, Jan. 29, payable within ten days.
Chs. Caney Mining Co.-50 cents per share, Jan. 21, payable on or befure Feb. 20th.

Sierra S. M. Co. An Assessment of ${ }^{2} 21 \%$ was levie Jen. 22 -payable immediately, at Office 575 Mission St.
Mount Javidon Co,-An Assessment of 50 cents per Share was levied. Jan. 23. payable on or before March lst, ut (Ifice 47 Montgonery Block.
dinatic- Fifty cents per share, pryable at No. 4 Armory Ihall, Sun Francisco, or to the Superintedent at the Nine. Hattie G. \&.S. M. Co.-Whirty cents per share, levied Jan. 31, payble at Office iu sim Lirancisco, or at the Mine. Male is Norcsoss-A Asessument of T'en Dollars per Share. levied Jan. 31 - payable at the Office in this city, or to John Skae, at the Mine, on or before Feb. 25.
Mina Prieta S. M. Co.-An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or brfore March 5th-at Office, cor. Montgomery \& Jackson Sts.
Recorder Mining Co.-An Assessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and bulance on or before March 20.
Hale \& Norcross S. M. Co. have levied an assessment of $\$ 5$ per share payable on or before Jan. 26 th.
Martin White. - An assesement of 20 ets. a share was levied, Jau. 2.
Oriental G. \& S. M. Co.-An assessment of 50 cts. per share was levied. Jan. 14. payable at Office, cor. Sutton Avenue and C St., Virginia City.
Baltimore America Consolidated.-An assessment of 50 cents per share was levied, Jan. 5.
Savage.-An assessment of $\$ 35$ cents per share was levied, Jan. 7.
Hawley,-An assessment of $\$ 1,00$ per share was levied Feb. 9, payable March 12.
Cole S. M. Co,-An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.
United States M. Co.-An assessment of six and twothirds ets. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8, Government House, San Francisco.
Sierra Nevada S. M. Co. levied an assessment of $\$ 15$ per share, Jan. 15 -payable Feb. 18.
Lady Bryan.-An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.
Ida G. \& S. Co. (Russ District)-An assessment of $\$ 1$ was levied, Jan. 14.

## assessment saldes.

Sales of Stock for non-payment of assessments are advertised to bo sold.as follows :-
Oriental Tunvel Co. will sell, on Saturday, Mar. 28.
Mars will institute proceedings against delinquents, Mar. 16 th.
Planet will institute proceedings against delinquents Mar. 16 th.
Moray Co. (V. City.-Suits for delinquent assessments will be commeaced, March 14 .
Michigan Co. (Gold Hill) will commence suits for delinuent assessments, March 16.
Lady'Bryan G. \& S. M. Oo.-Shares of delinquent stockholders will be sold at auction for assersments, at No. 400, Montgomery steet, on Jan. 27.

## general notices.

Yellow Jacket.-Corporate Deed now ready for signature t office of H. G. Maynard, Gold Hill, N. 'T.
Jenny Lind (Esmeralda.)-Owners of ground in this Cot are requestes to call and sign deed of trust at 608 Merchans St.
Mount Hope Co.-Persons claiming stock are reqrested present title papers for examination till $M$ arch 16 .
U. S. Mining Co.-All persons claiming stock are requested to present title papers for examination at Nos. $7 \& 8$ Government House.
Caution.-D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, standing in name of W. Williams. (See 'I'erritorial Enterprise.)
Ashland $\mathrm{Co}-\mathrm{L}_{\mathrm{L}}$. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lambledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.-The Office of this Company has been remored from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.
Ther Sweezy,Co., Gold Hill, give notice that Baltic

Company have wrongfuly claimed and worked their ground since July, 1860.
The chansy Rock Co., lying next west of the Tirginia Co. claims have notitied the Ilazel (ireen, lingley and Bt ach di Paxton Companys that they are tresspassing upou the Chimuey lack Co's groumd.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINIVG, MECHANICL AND SCIENTHEIC PAPER ON THIS CONTLNENT.
THIRD TEAR: VUIUME VI.-NEW SERIESI
A now volume of this extencively circulated paper commenced Sept. 11,
1862. It is intended that every number shall bo replete with informmion 1862. It is intended that every number shall bo rephete with informmion
concerning Miuing, scientifi, Mechanical und Iudustriul pursuits, torether with several original engraviugy, of vew juvedious, etc., prepared expressly for its columns.
Thls pupur is devoted to the above purposen, together with the interests of science, Arts, Akriculture and Commerce, tud any general infermation or to spure of pains or cxpensu in mulesug it equal in interest and valuable iuformation to uny paper yet published.

## The Mining Interest /

Will find it of grent ralue, as it will contain all tho newr appertaining to Mining, the prices and sales of Mining Stocks, new invelitionh of Alothinery daptel to that purpose, and of uvery thang generally that may be of service to tho Miner.

## The Inventor I

Will find it an excellent medum for the purpinse of bringing his invention into notice, of ascertaining the progress of invention in this and other
countries, and nlso of receiving any informatim that may bo vecessary in, obtaining his patent, the proprietor having had great experience as a latent Agent, together with facilities at Waslington that cuable him to ob. ain Patents with dispntch.

## The Mechanic and Manufacturer !

Will be greatly benefited by its perusal, as each number will continn rera eral original engravings of new machines and inventions, together with $\bar{J}$ large nmount of reading mattor appertaining thercto. Wo nre coustante
receiving tho bost scientific journals from atl quarters, from which wr receiving the bost scientific jourvals from all quarters, from which wr
shall continue to extract whatever may be of benefit or interest to oushall cont
readers.

To Chemists, Architects, Millwrights and Farmers !
This journal will be invalunble. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and
Sillwrights will be found in our columns. The Farmers and Planters will not bo neglected, engravings will be given of agricultural implements, and the farmiug interest generally will leamply discussed.

## Termas.

To maill subscribers:-Four Dollars per nunum.
Club Rates.
Fite Copics for Six Monthe, $\$ 8$.
Ten Copies for Sir Mouths, \$16.
ren Copies for Twelve Months, $\$ 30$,
Eifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, $\$ 56$.
For all clubs of Twenty and over, the yenrly subscriptlon is muly $\$ 280$ Specimen Specimen copies will be aent gratis to any part of the country.

## MINING--BOGUS AND BONAFIDE.

Investments in mining property are not necessarily so hazardous as most people imagiue. In opening up new mineral regions, and in evitering extensively upon fresh adventures iu old mineral fields, speculation will unavoidably creep in, to a greater or less extent. It is well, perhaps, that it does so. Man is naturally indolent, and unless the imagination is brought into pretty active play, as a stimulus, it is seldom that he accomplishes much. This confession may be somewhat humiliating, but it is nevertheless true Speculation-the desperate chances of large possible gain, combined with a natural desire for adventure, will often lead men of means to invest in miving operations, when all the calm matter-of-fact reasoning of the over cantious, will utterly fail to induce them to invest a dime. It is by such stimulus that almost all important mineral developments are brought out ; developments, which, if left to the ordinary routine of business, wou'd have continued hidden away in the secret recesses of the earth, for yeals and perhaps for centuries. So far, speculation is legitimate, and beneficial in enlarging the domain of industry. Individual losses may occur-they must, as an inevitable consequence; but the community is benefited, labor is provided for, commerce finds new channels, and the car of progress receives a renewred impulse in its onward course.
Here speculation, per se, ceases to be useful, and should blend in productiveness, by lending its aid to the actual development of such mines as promise a real value; while all others should be ignored. If the speculative world would be guided by such a course of operations, the public at large would not hare so unfavorable an opinion of this class of mining as is now geuerally entertained. That it is not so directed al all times is a lamentable fuct; but one fur which the complaining public is quite as wuch to blame as the speculators themselves, as will hereinafter appear.

Speculative mining is confined chiefly to great commercial centres, where capital aggregates. That class of mining leads, in this State, may be found in greatest abundance on Montgomery street, is this city. The radiating point of these leads appears to be located somewhere between $W$ ashington and Merchant street. They "crop out" at intervals all along the first named thoroughfure. Their "indicaticns" are distinct and unmistakable to the intelligent observer. The managers of this peculiar class of mines are usually denominated "brokers." Now brokers are a very useful and almost indispensable class of operators in all large centres of business. The community could not well do without them. Those of whom we are now writing may be divided into two classes-the mining broker, and the markel broker. Both, we assume and hold to be honest. The former is the one who calculates the merits or demerits of a mine independent of the market. The latter is one who studies the market independent of the value or prospects of the mine.

Now, if "operating" in these mines were confined exclusively to the brokers themselves, and on their own account, it is evident that but little progress would be made in advancing their shares. Of course the chief business of the broker is to buy and sell for his client. Now it lies altogether with the client which class of brokers le shall employ. If his object is a legitimate operation, he will employ the one who prefers to operate on the actual merits of the mine. If otherwise, he seeks out the less concientious agent who goes upon the street to "bull" and "bear" as the case may be, and put moneyin his own and his client's pocket, no matter at what sacrifice of principle. Such transactions are but little better, in their moral aspect, than the act of getting up a purely bogus mine, and selling in the market that which does not and cannot have a value. This class of operations are detrimental, in the highest degree, to all legitimate mining, and should be frowned upon by the entire community. The wrong in the case is usually attributable to the outside party, who if unsuccessful, is generally the first to complain of mining speculation. "Bulls" and "bears" are, however, sometimes serviceable, if they do not carry on their operations too steep. They are often the life of the market, and serve as the needed stimulus to action, not unfrequently being the immediate means, of bringing to life and activity mines of actual merit, which might otherwise have been allowed, perhaps for ages, to slumber in inaction.

The condition of the mining market, at the present time is cousid red by many as somewhat uminous Some confidently predict "a crash ahead," with "los and suffering' in store"-""a revulsion which will prove temporarily ruinous to our prosperity." We are not of those who adopt extreme views on either side. While we admit that an undue state of excitement-exists in the community we still have no fear of any serious depression-anything at all commensurate with the present buoyancy of stocks. There may indeed be such an over eugerness to invest as to give opportunity for he introduction of purely speculative or absolutely bogus mines, but such cases will be rare indeed. Our field for mining operations is too wide, too rich and too varied to nake such operations productive, to any extent. It actually requires less labor, and less financiering to hunt up, and place iu the marlet genuine operations with fair prospects of success, than it does to resort to a purely fictious basis. l'o say nothing of the splendid results already realized from uumerous first class mines, there are even now so many, wh ch were at first regarded as little better than "wild eat," which are now turning out better thun was anticipated, that even the minst cantous, are beginning to admit that we have too real and solid a basis, to be seriously affected by any number of unproductive adrentures $w$ hich present indica tions may warrant us to anticipate. The times however are somewhat propitious for intlated temporary operations, and it would be well for our citizens to act with more caution than heretofore in making investments. They should enquire more carefully into the merits and demerits of the mines in which they would invest, and exercise greater caution in the selection of agents, making careful enquiry as to their facilities and inclination 10 act as mining or market brokers. The same caution should be observed in the organization of companies, eschewing all operations not founded upon, at least, a fairly promising basis.
Mines under bona fide management, in good districts, with fair indications for future improvement and progress, must surely be worth investing in. Progressive mines are ever the most produclive of wealth. It is this class of mines, almost exclusively, which, to-day, having only a nominal value of a few shillings or a few dollars a foot, to morrow advance to a comparatively high figure, by some fortunate development, thus doubling, trebling or increasing ten or a hundred fold in a single day, the amount invested. The effect of an advance in one such, it will be readily seen, may more than compensate for a total loss in a great num ber of others. If you invest $\$ 5$ per in ten diffierent companies, and only one of these goes up to $\$ 100$ per foot, you have doubled your entire investment, and bave your chances still left in the other nine. The Mining List which we publish on the 6th page of this paper, exclusive of those of known and acknowledged value, reaches nearly 200 in number; we will call it just that number. As progressive mines, occupying a fair position as legitimate adventures, $\$ 5$ per foot, of assessments, ought tu pretty deffinitely determine whether they possess sufficient value for legitimate and extensive mining operations. Now if only 20 of the 200 prove reliable, and advance to a value of $\$ 200$ per foot, the total amount of investment will be doubled. If two or three of the number should reach the standard of "first class, "the proportionate increased value of the investment would be vastly increased. Now can any person with a knowledge of the brilliant successes and minor, yet important developments already made, entertain for a moment the iden that the list we give will ever be cut down to coly 20 productive mines? Yet teu only, would save us from acual loss !
As that list now stands, either the Ophir or Gould \& Curry, aloise, is worth more money than the entire'amount which has, up to this date, been expended on all the mines which appear in our list ; and were every other mine on the list to prove a failure, except the two last mentioned, the community, as a whole would be a gainer in wealth. Inconsiderate specalation may be carried to an extent which will work a lomited injury to a few individuais; bat it is idle and pre posterous to talk about anything like a general collapse in the incorporated mining interests of the State.

Efforts are being made in Australia to acclimatise in in that region English swans, hares, pigeons, grouse, etc.

## WORDS OF ENCOURAGEMENT.

It is contrary to our usnal custom to copy commendatory notices from our brethren of the Press, or to publish exhacts from the numerous letters we receive, whose writere are so kind or so partial as to make especial and favorable men ion of our efforts to furnish a paper which shall meet the wants of the mining public. Our course, in this respect, perhaps, is not so much the result of our innate modesty, as the couciousness that, notwithstanding the partiality of our correspondants, we really think the Press is yet far short of what such a paper should be. Although our circulation and other patronage is constantly increasing, it has not yet arrived at a point which will enable us to devote that time and money requisite to produte paper which shall properly represent the great aud important mining interest of the Fa :ific const. Our sheet is too small and the amount of matter to which we are limited, is quite too litule to give the paper that rariety and comprehensiveness, which the importance of the interest we represent demands. We hope, however, in a short time to be able, from the increase of our circulation and general business to do ourselves justice and to furnish our readers with a journal, which shall fully merit the good opinion which they have so generally expresseb with reyard to our efforts. We would take this oo casion to express our thanks to thos who have iuterested themselves in extending the circulation of the Press, both in this city, and throughoat the State and adjoining Territa ries. We append extracts of several letters, which, with others, we have received during a single week, to the write ers of which we are entire strangers :-
A subscriber near Carson City writes :-"In conclusion permit me to remark how well the mining interest of Califormia and Nevada is now represented by your paper, and that I hope it will soon be the means of communication and interchange of opinion betwe members of the miniug profession. Individual experience is always more or less limited; but if each mill-man or miner would but make known the resulte of this experience, a mass of information would be obtained, of the utmost value to all."
An enquiring correspoudent from a smull Mining Camp in Amador Co., writes :-"I have seen repeated notices of your publication, in the newspapers, but have never met with a number of it. It is doubtiess such a paper as miners need. Will you therefore be kind enough to send me a few numbers of it, it order that we may learn some-
thing about its character, terms, \&c.?" [The papers have thing about its character, terms, \&c.?" [The papers have been duly forwarded as per request.]

A gentleman in Aurora (Esmeralda) where we already had a very good circulation, writes as fallows :-
"Messrs Ewer and Smita :-I happened to see a copy of the Mining and Scientific Press a day or two since, and concluded to send and subscribe for it. But thought I wuuld try to get a few names to join to my own for the sake of convenience in sending. The result was that a trial of an hour or two succeeded in getting 21 names, the money for which I herewith remit by check on W., F. \& Co.
I hope to add yet more names to the list in a few days: I like the paper and wish to encourage it."

The Los Angeles Minks.-T'he papers of Los Angeles are giving encouragiug accounts of the mines in that coun ty. They are going ahead rapidly in the Soledad districtp Fine gray sulphuret of copper has been struck in the Mare shaft at a depth of 45 feet. The Santa Clara Company have found rich gold quartz on the Eureka lodes The Los Angeles Consolidated Mining Company, having completed the assersments on their fifteen lodes, will soon be ready for a most thorough work. They are now sinking upon the Euv reka, first South Extension. It is expected that they will reach the main vein in a few weeks. The outcroppings and foat rock in the extension above named, assay equal to the rock taken from the discovery claim.

The Humboldr Mines.-Tbe success of the mining interest of the Humboldt district, exceeds the expectations of the most sanguive. We look for important developmente from this region during the coming summer. Besides gold and silver, there has been found in this district, coal, salts, saltpeter, cement, cinnebar, and a species of building rook said to be superior to anything on the continent, in quality and the facilities of quarrying and preparing it for use.

THE IMPERIAL SILVER MINING COMPANY OF WASEOE.

This company, which has now been placed in the first rank of dividend payirg companies, hats recently been formed by a cousolidation of the Washoe Guld and sitver Mining Cu., No. 1 ; the Ilolnus Co., and the Alta Company. The Company, as now organized holds $183 \%$ teet of ground on Gold Hill and ownes the Rock Point Mills, which cost $\$ 250,000$ and the Novada Mills, which cost S150,000. The capital stuck cousists of $\$ 1,000,000$, divided into 2,000 shares at 今jub each. No asses-ments have ever been cafled for. The entire expense of opening the mine and constructing the mills, etc., has been drawn from the mine itself, as in, the case of the Ophir. The dividend which was declared, a few days since, $23 / 4$ per cent. for one and a-half months, on the capital stock, is equivalent to a monthly dividend of $\$ 100$ per foot. This dividend was independent of a reserve of $\$ 10,000$ toward a contingent fund. The company commenced crushing on the 15 th of February last. Simuel Merritt, M. I., is President of the Company and C. T. Hupkins, Secretary. Office at 405 Front street.

Virginta and Truckre Rallroad.-A bill creating the "Virgivia City and Truckee Railroad Company, with a brauch to Carson," was passed at the late session of the Nevada Legislature. John H. Atchinson, Gov. Johnson, Theodure Winters, and other substantial citizens are amoug the corporators. John F. Kidder, ongineer of the road, 18 in Virginia City, and will immediately begin a preliminary survey of the line.

## WASHOE STOCIS REMARIS.

For the week eudug \$1.urch 28 Lh 1863.
[Couphen fros tins Daly [mikiturial Entemplues.]
The bunimess of the just week hin beed large and generally satisfuctory.

 Grass Valley, Burnhy Muscow, Barnide, Labouring, Burcka, Uverman, Belelecr, Leoll, l'ulut, l'thees, Eutaye, tic.
Recee River stack to berng dealt tu spariugly. $\$ 30$ is offered for Magonio,
 Guld Hill stocks are still meetug with marked favor.
The Lady Bryau bin berin the charf object of uthaction duriag the week. Tou bew futereot whit segard to this mine has been cased by a strike of reld rock, much restmbling zud class Uphir. This stuck has gradually udrabced during the past week from $\$ 10$ to 817 , wt whith lutier tigure 10 chosd with an upward teudency. Sio wisto generally usked.
Gruss falley, wheh has been favorably operated upou by the ChollarPotoai declsten, trasually advancent from $\$ 10$ to $\$ 36$ atd $\$ 30$, which latter figure it reuched on the $2 \$ 1 \mathrm{~h}$ iabl. Yrom that lime it comantuced to deeline aud at the present cluse of the weet it may be quoted at $\$: 20$ @ $\$ 25$, with a downward teudency.
Burning Moseow, was in the market in small lots on Wednesday, at $\$ 200$, without purchasers. It was quoted on that day at \$100. Oll Snturday it hall dec limed to $\$ 160$, yet it is still Leld ubuvo quotullous at the bay.
Sucramento bis beon somewhat variable duriug two week. It was offercell liberally at $\$ 60$ (a) $\$ 65$ un 'tuebuay, without takers. It improved slight$y$ on Weluesday in cunsequence of orders fiom below, and still further udyances are reported to diy. It may huw be quoted firm at $\$ 60$ with demand. Miltus is agaiu liudiug its way futo market, uut is held at $\$ 80$ (a) \$95. Suata Rota is iu light demind at au advance. It mity be quated ue $\$ 65$.
La Conuse, wheneyer offired at low rates is elgeriy caught up.
Bloomingdale is in request at $\$ 4$ @ $\$ 5$, und is musketable at these figurea. Orieutal has eumewhat lost fuvor, which has been galned by the Durgan be elder title. The latier is saituble at from $\$ 5$ (0) $\$ 8$.
Utah is iu market in anail lots and is quotable at $\$ 45$ @ $\$ 50$.
Bullion is saleable at $\$ 40$ @ $\$ 45$. Belcher is advatuciu!.
Ei Durudo is rapidly gaiuing in the maiket and is leld at $\$ 90$ to $\$ 100$.
Walsun, the new consulidution north of the Madison, is held firmly at bealthy rates. There is a light demand for it at \$8 (3) 10 , winls lithe or uno ia markot.
Purviuw is readily purchased at $\$ 4 \overline{5}$ (a3 $\$ 50$.
Luboring, Guld Hul, hus beva in request all the week at \$10 (9) 12 , and 200 ut 300 liset have changed hands at these ligures. The company ciaims Jelge, if auy thate be: between the Union und Xellow Jucket.
Eurskit. Gold Hill has wot fluciuated during tho week. It is quoted at at $\$ 35$ @ 40, whin as madoy buyers as sollers.
Overmau has gahed slowly siluce Moudav and cannot be quoted at less than \$85. A large number of shares were sold during the weak at $\$ 30$ (a)
Belcher. Gold Hill, has steadily adranced and cannot be quoted at less thius \$140@150. It is held firmly at these bigures.
Galedonsa Tumel, Gold Hill, has tabsu a stride upward, and is in request t
Very fine specimens of ore aro being tuhen from Massillon, at Gold Hill, which bave vecushoued consideruble comment, and threaten of a suit with La l'mat Uro.
Kuuse haver stock is being dealt in sparingly ; $\$ 30$ is offered for Masonic, Lander Ledge, and liomet and Blue Lead are saleablo at variabio rates.

## LIST OF MINING COMPANIES HAVING OFFICES IN SAN FRANCISCO

## TEATMENT OF PYRITE ORES.

A patent has been taken out in England by J. Longmaid, for treating pyrites and other ores as follows:

The ores are first ground so as to pass through a sieve having about one hundred holes to the square inch. They are then introduced into a furbace where two processes are being constantly carried ou with the same heat. The first part of the process consists in the calcining of the pyrites, so as to reduce the sulphar in them to about five per cent.; and secondly, the decomposing of these calcined ores by common salt. The ground ores, when first placed in a chamber of the furnace, evolve sulphurous acid, which passes off into another chamber, where it is conserted into sulphuric acid

These calcined ores are now withdrawn, mixed with about five per cent. common salt, then placed in another chamber of the furnace where they are reduced. Ated obtain either the iron, copper, silver or tin which sraelted to obtain
may be in them.

## A Pearl of Great Price.-In the Loan Collection re-

 ently exhibited at South Kensington, London, was a pearl hich is believed to be the largest now known. Its weight three ounces; it is two inches in length and four in cirumference; its sides are nearly straight, somewhat widenng toward the lower part.carries it to a point between C and D streets. The work goes on day and uight, three shifts of hands being employed

The Josephine Company, of the Coso District, should be classed among dividend paying companies. The divid end of this company was paid on the 24th ult, of $\$ 1$ per share. The capital stock of the company consists of $\$ 1,200,000$, divided into 4800 shares of $\$ 250$ eacl.

Treasure.-The total Shipment of Treasure by the Orizaba on the 3 d inst., was $\$ 1,104,699$ 74. Of this amount

## PRODUCTION OF COPPER IN GREAT BRITAIN.

In 1861 there were 139 mines worked for copper in Eng land and Wales, cight in Ireland, and several in other parts of the British dominions. The entire yield of these mines, in ore, was 231,487 tons, valued at $\$ 6,800,000$, or a fraction over $\$ 29$ to the trn. The amount of fine copper realized from this ore was 15.331 tons valued at $\$ 7,838,000$. The difference between the total valuation of the ores produced and the value of the fine copper realized, should represent the costs of working and refining. This we find is but $\$ 448$ per ton of ore.
Copper Yield of Great Britain and the United States.-The United States, in all probability, will next year become the largest cepper producing country, in the world. The yield of copper, in Great Britain, for 1861 is set down at $\$ 7,838,000$. The value of rough copper shipped from Lake Superior in 1862 was $\$ 4,000,000$. The value of this shipment when refined will be enhanced about $\$ 838$, 000 , thus making the diflerence of yield between Great Britain and the United States, only $\$ 3,000,000$. The rapidly increasing yield of the Lake Superior mines added to what may be expected from California another year, will probably wipe out this difference and place this country ahead of England in its copper yield. According to present appearances, it is not unreasonable to conclude that it will not be many years before California will bring to marset a larger amonnt of rough copper and copper ore than all the world besides.

Varde of Ratloads.-We commend the following, from an English writer on the subject of railways, to the people of California:
"Railways have, when properly selected, been invariably attended with the following results: Increased Government revenue ; increased value of all property ; increased cultivation and produce, and expansion of manufactures ; increased accommodation to all classes for intercommunication ; diminished cost of all descriptions of goods to consumers, and increased consumption by accession of numbers; a measure of universal benefit without a drawback or
objection, if selected and carried out under due provisions, with judgement and discretion."
A correspondent of the Westminster Review, speaking on the same subject, says :
"Wherever railroads are constructed-whether they cross the American Continent, and link the Atlantic and Pacific Oceans, or line the banks of the Thames, the Rhine, the Danube, and the Euphrates ; traverse the burning plains of Hindostan, or the snows of Siberia-the maxim enunciated by Mr. Pease of Darlington, when railways were only experiments, on the success of which he had risked his fortune. will equally hold good, and remain unquestiouable evidence of his largeness of view and sounduess of judgment: the country but make the railroads and the railroads will make the country.'

One Hundred Tuorsand Coming !-Captain Crawford, who commands the escort provided by the Government for the protection of the present year's Overland emigration reports, by telegraph, March 30, that 50,000 emigrants were already en route for Calif.rnia, and that the number for the entire season would reach 100,000 .

ELECTRICAL PROCESS FOR AMAT,GANATING GOLD AND SILVER.
For some montlis past. Messrs. Norton \& Eddy, No. 616 Merchant St., have been quietly operating and bringiug to perfection, so far as may be, what appears to be a very important improvement in the amalgamation of the precious metals, by the application thereto of the principle of electricity. The process, which has been patented, and which is known as the "Norton \& Eddy Process," is simply the application of a current of electricity, generated in a battery, to the mass of pulp in the pan. Any ordinary amalgamaling pan may be used, by simply placing a battery of moderate power, having one pole connected with the quicksilvnr and the other with the pulp, and kept in that condilion so long as the process of trituration continues with any given charge of the pan. The results, as we learn several parties who have taken rock, and tailings to these gentlemen to be treated is most astonishing. We haye one result before us where a geutleman took 50 JDs . of tailiugs from a quartz mill, that had passed all the usual processes of amalgamation, but which under this electrical treatment returned a further yield of $\$ 06$ to the ton. The same geatleman took several other lots of rock to Messrs. Norton \& Eddy, from all of which he realized like satisfactory results. He has backed up his opinion of the process by ordering its immediate application to a mill in which he is eugaged near Placerville. Other gentlemen, who have had rock subjected to this process, have expressed themselves to us in like favorable terms of its results. We chronicle these results as among the passing efforts of the day to improve and simplify the process of working ores of precious metals in this State. We have no further personal opinion to express of it than the simple fact that the process appears to be advantageous, especially as it may be applied, at a trifling ex pense over and above, and in connection with all others, in use. It also appears to be perfectly reasonable and philosophical. It is now an almost universal admission that electricity if not almost the sole agent, is at least a most important one in the production of most mineral deposits. Its application to them in connection with the arts, as in electrotyping, etc., is now universal and still most wonderful in its effects. If it exerts such a powerful influence over these minerals when minutely divided in the shop or laboratory, why may not the same principle be applied on a larger scale, in the quartz mill, and in collecting those minute particles which have been separated or but partially collected in the great laboratory of Nature? The experiments of Messrs. Eddy \& Norton seem to answer this question most deffinitely. We would recommend persons interested to call and examine this process for themselves, at No. 616 Merchant St., in this city.
We understand that this process has been tried most succersfully upon concentrated sulphurets. A lot of sulphurets supposed to be only of ordinary value. were recently subjected to the process, and the result shuwed a yield of $\$ 2000$ to the ton. The quantity worked was an ordinary charge fur the pan. In addition to the introduction of this process to a mill in Placerville, we understand it will be more extensively tried in one of the primcipal mills in Washoe, ar-
rangements for the same baving already been consumater. We shall be informed of the re-ults at these mills as soon as they can be obtained and shall promptly communicale them to our readers.

Coppfr.-We were shown on Saturday some very rich specimens of copper ore, taken from a vein lately opened at Rouse's Ranch near Grass Valley. The specimens were taken out at a depth of twenty-five feet below the surface, and some of them we should think contain at least eighty per cent of copper. The ledge was worked some ycars ago for gold, but failing to pay was abandoned. The ledge was relocated last fall by Mr. John Armstrong, as the "Excelsior Sulphuret Mine" and a company has recently been organized to work the same, under the title of the "Nevada Copper Mining Company."

The Napolfon Coprer Mine.-This mine has recently been placed under the supervision of Mr. Joseph Powning. a gentleman who has had much experience as a copper miner, both in Cornwall and at Lake Superior. Mr P. has also become quite largely interested in its stock. We understand that the wonkings at the sine are to be very materially modified and improved, a step which cannot fail to operate most beneficially upon its future. Some very rich rock has recently been struck, with good indications for continuance.
The Lady Bryan.-Mr. Owens, the Superintendant, yesterday showed us a magnificent specimen of ore from the Lady Bryan ledge. This is a ledge twelve feet in width, running north and south, with well defined walls ou the east and west sides of it. The rich, or what is termed the "pay streak" in the ledge, is twelve iuches wide, with black sulphurets running all through it. A shaft. now forty-three feet deep, is being sunk down along the hanging wall of the ledge The water is already flowing into the shaft quite freely. [Virginia Cily Union, April 4th.

The Comstock Case.-In the case of the Comstock vs. Pride of the West, triedin the Third District Court, at Dayton, on Wednesday weel, the jury rendered a verdict in favor of defendants. The Comstock Company will appeal the case. The suit was the third trial of the same cause, and the first in which the jury went on the ground.

Wiat is Thought? A fountain from which flows all good and evil intentions; a.mental fluid, electrical in the force and rapidity of its movements, silently flowing unseen within its own secret avenues; yet, it is the controlling power of all avimated matter, and the chief mainspring of all our actions.
What is Knowledge? A key that unavels all mysteries, and which unlocks the entrance, and discovers new, unseen and untrodden paths in the hitherto unexplured fields of science and literature.

We understand an evening paper is about to be started in Virginia City.

## THE HUMBOLD MINES.

The following letter, written for, and published in the Mountain Messenger, of the 1 5th of Norember last, contains the fullest and most completo account of the miaing operations in Humboldt, which we have seen. Those of un readers whu desire to post themselves with regard to this new mining region will do well to read it carefully. The let ter was written by Mr. M m . A. Holcomb, one of the earliest adventurers into that distant region, and now Treasurer of the county which has been organized there, and a most intelligent and experienced miner. Me is now in this city We have had the pleasure of several interviews with him, and he has asssured us that he will hertafter keep our readers thoroughly informed with regard to mining matters in that locality, by contributing to the Mining and Seientific Press.

Editor Mountain Messenger:-Not having written you for some time past, you have perhaps come to the conclusion that I have become disgusted with silver-land, have taken up my blankets and skedaddied out of the couniry. In order to cunvince you that such is not the case I drop you a few lines, and give you the resuit of my obserrations while on a recent.trip around the mountains.

Afier securely bolting and barring all the doors and windows of my stately mansion, I took up my line of march for a visit to some of our mining districts, which I had often heard of but never seen. 'fraveling along the low foot-hills, covered with sage brush and greasewood, with here and there a scrub cedar, I pursued my course, crossing Coyote and Star Creeks, leaving Star City to my left, and finally reached the flourishing village of Santa Clara, where I found ny friend A. J. Simons, (one of Humboldt's Representatives in the Territorial Legislature, with his feet elevated considerable higher than bis head, and dividing his time between Blackstone and a kettle of beans which he was cooking over a slow fire, evidently expecting the arrival of some hungry miner. Irather think he came to the conclusion, before 1 finished my dinner, that the aforesaid hungry individual had arrived.

Santa، Clara is situated about fourteen miles north of Unionville, is a pleasant location for a town, has a rery enterprising and industrious population, and some of the richest silver ledges in the range. Among the richest of them are the Magna Charta, Butte, Wyoming, Tehama, Kentncky, High S'ar, Accident No's. 1 and 2, Siskigou, Last Chance, Yellow Jacket, and Twilight. The Magna Charta tunnel is in 240 feet, is now in the casing rock and within a few feet of the ledge. They have passed through several small veins or spurs which show rery rich mineral. The tannel is being ran by two companies, the Lager Beer and Sparkling Wave, at right angles with the ledge. Two companies are located on the Butte ledge-the I'ehama and Cherokee. Both companies have sunk shafts on their claims and have taken out some very rich rock. The Cherokee Co. are now running a tunnel, under the supervision of Adam Folk, to open the ledge at a depth of 200 feet. This company intend opening their claims this winter and erecting a mill early in the Spring. The Tehama Co. will take out quartz through their shaft for the present. Eight tons of this quartz was worked by the Cherokee Co. during the Summer, with an arrastra, without the silver process, and yielded a little upward of $\$ 250$ per ton, which has established the richness of the ledge beyond a doubt. This company receutly sold 108 feet of their ledge for $\$ 100$ per foot. The ledge was discovered in September, 1861, by Jack Pow ers and A. J. Simons. The Wyoming tanael is now in a little orer one hundred feet and the work still progressing. The ledge has been thoroughly prospected from the surface by a shaft, and the quartz has prored rich. The Tehama, Highton, Kentucky, and several other ledges in this district, are being prospected with tunnels, and promise equally well. The population of Santa, Clara is about one hundred. There are four families in the place, and another is expected to ar rive shortly.

After remaining $0^{\text {eer }}$ night in Sunta Clara, and enjoying the haspitality of friend Simons, I crossed over the mountain, a distance of four miles, to Prince Royal, or Lasseuville, which is a flourishing little mining camp, situated in a deep cañon on the west side of the mountain, and near the
the district, and two families. This district has many rich hours and a half, I reached the summit, where 1 had a fine ledges, the most noted of which are the Newton, King, view of Unionville and the surrounding country. I stopWebster, Sallust. Coulthurst, Daris, Esop, Socrates, Key- ped on the summit for a short time, to rest and refresh my-
stone, Mark duthony, Iankee Blade, Lassen and Prince selt, and then conmenced descending. The descent is very Royal, which are all being prospected by tuanels. The New- steep, but 1 managed to make the trip down the mountain ton tunnel is in one hundred feet, is now rery near the ledge, in much less time than it had taken me to ascend, and I and has been cut through sereral small veins which are rich. The King tunnel is being run on the oppusite side of the hill from the Newton, intendiug to intersect at the centre of the ridge. These tunnels, when completed, will be 800 feet in length and will open sir ledges-the Newton, Sallust and Coulthurst on the east side, and Ring, Webster and Davis on the west. A tunnel is being run into Esop Mill, which will open three ledges-the Esop, Mark Anthony and Socrates. This tunnel is now in 85 feet. The Keystone tunnel is in 65 feet, has about 130 feet further to run, and when completed it will open three ledges-the Keystone, Yankee Blade and Lassen. The Prince Royal tunnel is in 65 feet and is very near the ledge. All of these ledges will be opened this coming winter, and Prince Royal Distruct will be able to furnish quartz enough to keep several mills running next summer. The Louis Napoleon, Lincoln, Fort Pitt, Prnnsylvania, Honey and Washington are all considered, first class ledges. Arrangements have been made to have a twelve stamp steam mill erected in this place early in the Spring. I mast give Prince Royal District the credit of having done more toward developing the mines, in proportion to the number of inhabitants, than any other district in the range. I remained cne day in Prince Royal District, and was well pleased with the indications.
After learing Prince Royal, and traveling down the mountain four miles, in a westerly direction, I arrived at the oldest settled village in these mines-Humboldt City. This place is pleasantly situated, contains about sixty houses-some of which are fine ones-has a population of about one hundred and fifty, and seven families. The town does not appear to be very lively at present, as many of the miners have gone over to California to lay in their supplies for the winter. The ledges of this district are large, well defined, and full of mineral. Among the richest of them are the Cuba, Crittenden, Canada, Huntington, Louisiana, Humboldt, Cape Cod, Winnemucca, Melrose, Constant, Santa Anna, Nississippi, Flurida, California and Cutler. The Cuba tunnel is now in one hundred and seventy-five feet; they are on the ledge, and taking out very rich rock. 'The Winnemucca is in 50 feet, and this company have just struck the ledge, and struck it rich.. The Crittenden is in seventy-five feet, and the company have about twenty feet further to ran. They have run through a spur of this ledge, two feet wide, which prospects very rich. The Canada has a shaft, 25 feet deep, suak on the ledge. The Buntington taunel is in 60 feet, and there are about 20 feet further to run. The Louisiana tunnel is in 125 eet. This company have not struck the ledge with the tuunel, but are taking out good rock through two shafts, which are now down 40 feet on the ledge. The Ed. Payne Co. have a shaft, 55 feet deep, suuk on the ledge. They have had to suspeud the sinking of their shaft on account of water, and are going to commence a drain tunnel soon. The Califormia Company have their tunnel in upward of 100 feet, and have about 25 feet farther to run. Sereral other companies are running tannels to open their ledges. Judge Horrell has the machinery for a steam mill on the road for this place. The mill is to be erected immediately. A company is about being organized for the purpose of convering the water from Hamboldt River in a canal 13 feet wide and 5 feet deep. The canal is to be $23 / 4$ miles in leugth, and a fall of 21 feet can be attained in that distance. This project, if carried out, will furnish an immense water power, affording fine facilities for working the ledges in this and Prince Royal District. I remained two days in Humboldt City, visited several of the tunnels, examined the ledges, and I an well satisfied as to their richness.

After leaving Humboldt City, I continued my course down the west side of the monatain for eight miles, journeying along the old emigrant road, where I traveled several fears ago, when I was a poor, god-fursaken, barefoot emigrant, chock full of alkali. Little did I then thiuk that my fortune and the fortunes of thousands, lay burried beneath the lofty mountain tumy left. After crossing Eid Dorado and Spring Cañons, I commenced ascending the mountain. After pulling and tugging, sweating, panting and climbing for two
and hungry.
I regret not haring had time to visit Star Cify, but I every day hear favorable accounts from this district. Star District has as many good ledges as any other district in the ange, and bas excellent water privileges, which is an small item in in this country. Considerable improvement is going
ou in Star City iu the way of building and opening ledges. The principal ledges in Star District are the Sheba, Fravk lin, Manmoth, Almo. San Barnard, Yankee, Slabtown, Arch, Mountain top Pines. Haviland and Jeff. Davis. Most of these ledges aro being thoroughly prospected with lunnels, moth, Yankee, and several other companies, are working on their ledges and taking out large quantities of rich rock Homfray's Mill is now in running order, and you may soon look for glorions accounts from Star.

Considerable work is being done in Indian, American, Sacramento, and Echo Districts, though ant so much as in the other districts that I hare mentioned; but all of them have rery rich ledges. which, doubtless, will some day make millionaires of therr owners. The Moonlight ledge, in the Indian District, is one of the richestio the range, and is now being successfilly worked.
Last, though not least, I mention Buera Vista District, which has a large number of valuable ledges. The Nation al, Alba Nnera, Downey, Comet, Empire, Mars, Lander, Golden Fleece. Eagle, Chameleon, Congress, Tom Moore,
Jacksnn, Buckere, Blue Bell, Oalifornia, Keystone, St Lous is, Mary Ann, Mary Bell, Peru, Chile, Cass and Independence, all rank among first class ledges. The National, Alba Nueva, and Mars Companies have taken nut a great many tons of quartz from ledges. The Peru, Eagle, Congress, Jackson, Buckeye, Keystone, Empire, and several other companies, are working on their ledges. The Adrenturers Company, on the Chameleon ledge, are going to onen their claims this winter. The proprietors expect, when their claims are opened, to take out some of the richest rock ever found in the Territory.
Unionville is improving rapidly. It now has a population of about four hundred and fifty, about thirty families, a large number of fine buildings, and already has quite the appearance of a city. Fall $\& C^{\prime} \in$ mill will soon be in run ning ordel. We hare a large school-house nearly completed,
which will answer both for a school-house and a church. Its cost is a about $\$ 1,500$, which was raised by contribution of our citizens.

A good many real and sham capitalists have visited our mines during the Summer and Fall. It is a difficult matter to distinguish the real from the sham. They are all known by their long linen coats, and it is qenerally supposed that he who wears the longest coat has the heaviest purse. It would astonish you to see what an affection some of the sharpers (who have feet to sell) have for the long coated gentry. But long coat tails are about played out, as some of our boys, in order to have a little fun of their own, have commenced putting on the long coats. Many of the aforesaid pretended capitalists are not on the buy, bat are very anxious to have feet in good ledges given to them; and they are willing to pay for said feet by giving tone to the ledge: they may be interested in. This dodge arn't exactly the thing, for, as a friend of mine very properly remarlis, the mi ners have lived too long on sage brush and bunch grass, to
dispose of their rich ledges in any such a manner. A party dispose of their rich ledges in any such a manner. A party
of San Francisco bloods-men of capital I am told-recently risited our mines, remaited a day or two, and returned to San Francisco thoroughly disgusted with the country, pronounced the mines a complete humbug, and advised their friends not to invest in Hunboldt stock. Now, I am informed by reliable parties that these heavy capitalists did not visit a single ledge, and no one could make them believe that there were any silver ledges here. Some of them quired for timber and were told that there was plenty of it ou the rance of mountains east of this place; but they, like doubting Thomas, would not believe. You can see by the statement I have made, (and I am willing to be sworn as to its correctness.) that a very large number of ledges will soon be opened. Then we shall be under no necessity of seeking capitalists ; they must seek us, and they will find us when they come down with the cash. We have quit running on shane.

The miners of Humboldt county are deserving of a great deal of credit for their energy and perseverance in developing so extensive a mineral country as this. they were without means, cormanding scarcely any capital beyund their own labor, and being in a country where pro risions of all kinds and mining tools were held at high fig-
ures, they have accompilshed as much or more than any equal umber of men erer did accomplish in the same length of time, and under such adverse circumstances. This may not be the oninion of some, who hare not taken the tronble to inrestigate the matter but it is the opinion o
Unionvilif, N. T.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoreries of valuable mineral deposits, other than gold, in almost every section of the state, which bave of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metaliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of aay rock or earth for gold is an extremely simple process. If its presunce is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable te-t. If in rock of any description; thal rock pounded fine in a mortar and washed, in the sause manner as alluvium, will usu.lly expose its gold to the naked eye, if there is any there in paying quautity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by whick means the sulphur will be evaporated, and the copper, if any is preseut, changed to a dull red col 1 r, and the gold retaining its natural appearance, ou subjecting the whole to the usual panaing process, may be readily seen by the naked eye.

Not so with othermetals. Silver, copper, zinc, nickel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most praccical and scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. Alter reading deseriptions, however, and carefully examining the specimens described, the explorer may go out and search with some degree of confidence and intelligence. A study of the characteristics of the sulphnret ores alone, would lead an explorer to pass over, entirely unnoticed, the richest varieties of the ores known as Chlorides or Hurn Silver, which, from the facility with which they may be worked, and their usual richuess, are generally considered the most valuable of silver ores. There is much reasoc to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of iustruction, to acquire a practical minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come acruss specimens having the appearance of rarity or value, to carefuily examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.

Our object is to furnish the miuers of California with every class of information which shall be valuable to them in the progress of their calling and in .the developent of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners thau in the manner here proposed. The only equivalent we ask is that they shall do what they reasonably can to sustain and improve the paper devoted exclusively to their interests.

In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. Tue ordiuary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarceIy a piece of quartz or rock of a quartzoze nature, which presents any uncommon appearanco in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or npar a vein of quartz it should be carefully examined "in place." and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be valu in it. althongh the gold may not shine there. We shall commence in our next issue a series of articles de-
scribing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notic؛ of the Californin prospector; and we have the promise also, at an early day-probably within a week or two-of a series of articles under the head of "The Mi ner's Laboratory," which will be prepared especially for this paper by one of the most skillful metallurgists on this coast, and which will be found of great value to the mining public.
A Useful Inventron.-By invitation of the inventor, Mr. Alfred E. Frick, one of the popular conductors of the Maket Street Railroad, we recently examined, at his residence, near the Mission, a working model of a most useful and ingeniuus machine, which he has just perfected, and for which he has taken the qecessary steps to secure a pat ent. This invention may be called a "packing machine," designed more especially for the putting up of small packages of coffee, spices, mustard, etc. It is most ingeniously constructed, compact and simple, yet so perlect and effective, that with it two boys can perform the labor of six med by the old hand process-and do it much better.
This machine is especially valuable for packing coffee fo the reason that the pressure produced operates to so comgress the grains of coffee (ground) as to almost entrely ex clude the air from the package and thus preserve the aroma, which is the strength and real excellence of coffee. The packages, when filled, instead of being loosely tied with strings, are hermetically-or nearly so-sealed with paste. By this means, the bouquet of the coffee, instead of escaping thro' the folds of the paper, is preserved until the package is opened tor use.
It is dificult to give a very intelligible description of the machine, without anillustration, hut the reader may perhaps form some idea of it from the following: The coffee or olher material to be packed is placed in a hopper from which it is distributed, through valves into three or more boxes, the exact size and shape of the package to be made, and into which the paper has first been placed. After the material has passed through the valves, they are closed and made to operate as levers or stamps; the bozes being placed on a table or platten below, and by a sinuple movement made to move up against them. The coffee, or other material is thus closely and neatly compressed. The inventor claims for his invention the following qualities: 1 , economy of labor; 2, economy of packing material; 3 , superiority of the article packed over the the same quality of a similar article packed by the kand process.
Rain.-Two juches of rain fell in San Francisco during the mouth of March, making the entire amount for the season thus far 11.78 inches. Last seuson the entire fall of rain here equalled 47.75 inches.
Snow--I'he amount of snow which fell this winter, up to March 1st, at Hermit's Valley, on the Big Tree road, near the sumnit, was 14 feet 7 inches. The amount that fell during the currespouding lime last winter. was 52 feet.

Thate it Costs.-It costs twenty dollars a ton for transportation of merchandise per hundred miles on an ordinary road, two dollars on a railroad, and twenty cents on the ocean, for the same distance.
Hallidie \& Co., of this city, have entered into a contract to erect a wire suspension bridge across the Frazer, about a mile from Chapman's Bar. It will be the first work of the kind constructed in British Columbia.

Singelar.-There is a plant growiug in the spriags of Iceland, which not ouly florers luut bears seed, in water hot enough to boil an egg. So says Russ Browne in one of his letters to Harper's Magazine.
The Dnnaghmore furnace, in Lebanon, Col. Hammond, manager, has been in continued blast for four years and twenty-four days. Throughout that time it has averaged $1193 / 4$ tons of iron per week, and has consumed but $1 \frac{1}{8}$ tons of coal in the production of a ton of iron. The Donaghmore is a twelve-foot furuace.
Patnt to Endure.-It is said that boiling coal tar with lacked lime, will make a shining surface on woodwork, and walls of any kint, which is as imperishable as stone, and therefore valuable for out-houses, \&e.

NEW DISCOVERIES, ETC., IN THE VICINITY OF PLACERVILLE.
In November last we made mention of some recent gold discoveries near Poverty Point, in the ricinity of Placerville. The lapse of time since then has proved, most conclusively, that both Poverty Point and Poverty Bar, as applied to that locality, are misnomers-for this vicinity has now proved to be one of most extraordinary richness.
The New El Dorado Co., of which we made mention has since put up asmall steam mill upon their vein, but were pernitted to run it only long enough to develop a ledge of extraordinary richness, when an injunction was served upon their further operations, by another party who claimed priority of title. This suit is not yet finally decided, although the Fl Durado Co. are confident of winuing.
This mill has now been leased by Mr. A. F. Mitchel, of this city, who is quite extensively interested in valuable "feet" in that vicinity. Mr. M. will soon start up the mill, with rock from the claim adjoining the El Dorado. He will employ, as an adjunct to the stamps, a new process, which has recently been patented and perfected in this city, and which will be known as the "Norton \& Eddy Electrical Process," This process is fully described, elsewhere in our columus to-ilay.
The New York Company, on the same lead, have just started a water-mill with the capacity for crushing 10 tons per day. They have sunk a shaft 45 feet deep aud run a tunnel 60 feet, and are now taking out very rich rock. On the extreme northernly end of the El Dorado, a company has struck the continuation of that veiu in a 14 foot shaft which shows very rich rock, carrying coarse gold.

A new lead has also been discovered, runniag parallel to the New York, and located by the American Co. An aver age lot of 480 Hs . of rock from this ledge worked in this cily by the Norton and Eddy Process, yielded at the rate of \$78,85 per ton, carrying about six per cent. of silver. All of the rock in this vicinity yielded a small parcentage of that metal, in connection with the gold.

A somewhat remarkable, yet most fortunate accident occurred, about three weeks since in the tunnel of the Poverty Point mill. A large slide occurred, which oearly destroyed the tunnel, and as it had not been paying anything of consequence for some time the company were about abandoning their ground, when, upon a more carcful examination of the slide it was discovered that an entirely new vein had been exposed parallel to the old one, and only six feet distant from it. On further exploration this was found to be the true vein, about six feet thick. The coropany has now started in anew, with most encouragiug promise, and high hopes of future success. A new ledge has also been recently opened near Chili Bar, in this vicinity, which presents every indication of proving rich. It is 15 feet thick. The company have takeu up a water power upon which they propose erecting their mill.
'lhe Pacific Quartz mill, which is located directly in the town of Placerville, has recently thrown away the arrastras, which they have heretofore used, and substituted in the stead pans-of whose patent we have not learned. We ur derstand that the change has proved most satisfactorytheir rock yielding by the new process nearly 50 per cent. more than they have heretofure obtained.

A Mining Item for Smorers.-Some five or six weeks since, ten individuals, belonging to the Dashaway Association of this city, all inveterate smokers, agreed to abstain from their favorite weed for a period of six months, and iovest the usual expenditure for that luxury, in a common fuml for their mutual benefit. In about one month this fund reached the amount of $\$ 200$. It was then resolved to invest that sum in mining stock. The "feet" were according. ly purchased, and one eveuing last week the announcement was made that their "stock" had advanced to $\$ 500$ in value.
The above item furnishes a striking evidence of the expensiveness of the habitual use of tobacco, and the great advantage of a judicious investment in mining stock.

Homboldt Sait.-It has been ascertained, says the Virginia Uuion, that beneath the stratam of loose salt lately discovered in the Humboldt district, N. T., there is a bed of crystalized salt, ten feet thick. Pieces of this rock are is traosparent and white as clean ice.

GENERAL MINING STOCK REPORT．
REPURTUF SA\＆ES
At the San Franuliwe Mining Stock Board， For the weok whag April 1 th， 1863.

## REMARES．

A greater firmness and better feeliug bas pervaded the mining market urling the past week than ever before．The transactious have also been unte us heavy ant numerous as during aniv previous wouk．Both specula－ iun and a destre for persobal luvestmeut have influeuced movements，aud
muterial advabce in stocks has been the genolat result．As an ovilence omerased activity in the mirk et，and the growing interest which capi－ ahsts are tuking therein，we may mstance the significant fact that the Ex－ lange Board have recently ficreased the adminsion fee from $\$ 500$ to 1000 without producing any perceptrible decrease to the number of applicants． In Ophir but little has been done，one transaction only havilg taked arid a dividend of $\$ 48$ per foot，on Weduestay last．They havo just made him last payment of $\$ .5,000$ on account of the Virginiin purebase，aud now， ocing out of debl，and the mine in goud working order，it may be presumed
hint their next dividend will come up to former agures，with a pouterma dyadee ill their stuct．
Gould \＆Gurry．The marvelously rich strike recently made in thin com－ pawy＇s mine has ereated an unurual demand for its stock duriog the week．
her tharket for the week opened at $\$ 3200$ and ntendily advanced to a clom－ M＇price or 6650 cash and 3800 on 90 datys．The revelopments niluded to rie made in a new shaft 15 fuct below the present workiug，from which as lakeu about half a ton of mativo silver，estimated to bo worth somo Siv，000 ！Farther important developments aro looked for by Lolders of
iturk，with so mueh continence，that it is dificult at this writiug to liud sturk，with no much contineuce，
ellers at any reusonable price．
Savige bas also come in for an unusual share of fuvor．The report dur－ of the carly yart of the week that they had＂struck it rich＂at the mine， at the effect to advance tbe price of shares some $\$ 400$ uver quotations of t week．This stock may be quoted uow at $\$ 1700$＠ 1800 ．
Hale \＆Norcross．In consequence of the happy＇，hit in the Savage，the fale $\pm$ Norcross，which is the next location on the same ledge，was consid－ rably enquired for，but without any very material advance over previous notations．
The Dancylas been quite active during the week，and is much sought at er．Ahout 1600 fliteres（ 400 ft ．）Lavechanged hands at rates materially dvatuced uver provious gutatious．The new mill of this compauy has
done into operation．The result of the frst week＇s crushing was $\$ 10,000$ rom into operation．The result of the trst week＇s crushing was $\$ 10,000$ rum $I 50$ tons of rock．The second＂clean up＂has just been reported，with
very material improvament in yield．＂g0 tons yiclding $\$ 21$ ， 000 ＂is very material improvement in yield．＂90 tons yielding $\$ 21,000$＂is re－ ported．A fine streak of ore＂splotched＂with nutive silver，is sald to have very valuble mine．The luttering resules abovo noted，are attraoting much attention to it．
Egarbraida Mines．－Tbe cspecial iuterest attached to the recent important levelopments at Virginia City，appar，for the time being，to have drawn off attention somewhut frum the Esineralda mines，From the local papers bere，however，and from private information we learn that most active
feforts are now being made to properly develop the mineral resources of that locutity，as woll as the regiell still bulow，on the Lastern Slope．
Treappud our jusaal record of transactions，and rejorts of interior Sining Dlarkets．

## WASHOE STOCK REMARKS．

The business of the pust weak foots uf momewbit less，io the nggregato than the trathactious of the last，thet a falr amount of dealing is repurted． Althongh consmerablo ductinatom has vecurred，the geteral sebdeacy of stocke is unward，and the market givea promise of emblaued improvement． Burning Muscow is still fluctunthg，und may be quoted at $\$ 130$＠ 140.
Sacraturinto luts declimed somewhat during the week，and may be quoted

## －day at \＄00 © 82 ！

Luah has myanced $\$ 10$ und Is seling at $\$ 52$ and $\$ 65$ ．Work is about be－ ing communced on the milue．
Alfers is mantulned at $\$ 05$ and $\$ 70$ ，with but little stock in tbe market． Burasido has cleclined sotaewhet，and may now be quoted at $\$ 40$ to $\$ 46$. Potosi is advaticing，and is it dem sud at $\$ \mathbf{i t 5}$（9）$\$ 400$ ，with little offering． Soray has beon is request at $\$ 30$ and $\$ 35$ ，with plenty of buyers．
Lat Crosed ifstill without demand，and is in the market at sio and is Belvidere is firm and saleable at $\$ 20$ ，with little ill market．
Cule in in requent at $\$ 15$ for large lots，althougis the dealing in it during wetk has been light．
Moute Cristo after a long quiet，is in requent again，\＄1る being bld．
Madison is offered at $\$ 18$ to 20 ，without buyers．It may be quoted at \＄15
Texar is advaucing alowly，und may bu queted at $\$ 8$ and 9 ，with a fair demand．
In Gold Hill an adranco is observablo and considerable business has beon done in shares．Overintin is saleable at \＄45，und is rapuly changing baude． Belcher is firm，at \＄125 and $\mathbf{5 6 0 \text { ．Kols－i－nuer is firmly held it about the }}$ same ligures．The ledge in controversy by thess compunies is one of the best in the Territory．
The Eureka was maintained at $\$ 35$ and 40 until to－day，whon develop－ uents suddenly advanced it to $\$ 50$ and 65 ．Such is the report from Gold Hill．
Duna has declined to $\$$（a3）5，but shows symptoms of a rally．
Prinecss and Bullion remain at about $\$ 40$ and 45 ．
Buchavao is saleable at \＄100 and 175.
The leading feature of Saturday was the developments in the Savage． On Friday ore of the vory richest character wass struck，and brought to the surface siturday．It is equal to the No．I rock of the Gould \＆Curry， which it vory mucl resembles．The result has beou tha advance to about $\$ 2,000$ ．
Santa Rita is in the markot at $\$ 80$ © 65 ．Thero is something of a dispo－ sitiou to deal in it at lower fgures，but it is held firmly．
Birdsall is marketable at $\$ 20$（3） 4250 ，with an upward tendency．It is in the market in small lots at $\$ 45$ ．
Milton is quotable at $\$ 80$＠ 85 ，although it is sparingly dealt in at these figures．
Pride of Washoe is offered at $\$ 35$ ；without bidders．It cannot be quoted t more thau \＄30．
Osceolu may be quoted at $\$ 9$（3） 10 ，with some request．
We quote Huzel Greas at \＄5，Bloomingdale at 5 ＠ 6 ，York at 5，Allen at 30，Recorder at 20.
Yellow Jacket is ollered at $\$ 325$＠ 350 ，without tabers．
Uuion is offered at $\$ 50$ ，in sinsll lols．It may be quoted at $\$ 45$＠ 50 ．
We quote Galedonia at $\$ 15$ ；Baltic at 16 ＠ 18 ；Leon at $\$ 30$ ；Yolo at $\$ 15$ （a）$\$ 18$.

Best \＆Belcher is being dealt in to some oxtent，
Beach \＆Paxton is attracting cousiderable sttention from the great idth and favorable appearance of its ledgu．lor 50 feot $\$ 236$ whs offered to day，without sellers．
Keystone－Nebraska is bsing denit inät $\$ 10$＠ 12 ，with something of a demand．
20 fect Sacranento sold to day ai $\$ 62$ ．

Bodie，No．1， 55 at $\$ 18$.

WHEELER'S
Amalgamating and Separating Pans.
It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating aud amalgamating purposes to any other in use.
The mnst important principle connected with the ope-
ration of these Pans is the separation of the trituratiug process from thr of extracting the amalgam from the saud. The shiet cause of loss of the precious metuls ari-
ses from the passing off of the same in combination with ses from the passing of of the same in combination with
the quicksilver, during the proces of trituratou,
 to flow. The trituration this loss is entirely aroided. In
working these machines there is Do npprcciable loss of Working these machines there is po apprcciable loss
quicksiliver, and helice none of the precious metals.
Where these Pans have been introduced and operated
by the side of others on sands from the same vat, the by the eide of athers on sands from the same rat, the
Whlveler Paus have uniformly gained n Iarge percentage of metals over its competitors, as well as a still larger
perceutage ji the ampunt of work performed.
*** These Pans mad be seen in daily operation, at the Miner's Foundry, oll First street in this city, where all interested are invited to call and examine for themselve

## eUartz reduction and goid amalgamating MACHINERY.

At no period in the history of mining has there been such an intelligent and practical application of inventive genius to mechanical contrivances for the reduction of quartz and the amalgamation of the precious metals as at the present time. An experience of twelve years in this branch of industry on a ecale of magnitude without a parallel in either time or place has advanced Californians to the front rank of experimental miners; and at this time the mia ners of the old world-even the veterans of Cornwall and Wales are looking to California for the latest and most approved machinery in our peculiar speciality of extracting gold from its matrix. One of the most successful operators in the newgold fields in Wales, is a gentleman whose most important practical experience was obtained in the mines of California and Washoe.

In machinery for reducing quartz, we are fast narrowing down to a point. The numerous contrivances of mammoth "impingement" wheels, of ponderous rollers, cylinders, balls, etc., have all been castaside forever, and there is every reason to believe that the few experiments which are now in progress will soon result in the adoption of a principle which, by common consent, will be recognised as the most economical and effective application of machinery to this purpose. If stamps are to be used, with the "wet process" triturating pans mast come into invariable use, in connection with them. The experiments of the past two or three years have fully satisfied all practical miners that no "wet process," except grinding, will pulverise quartz to a sufficient degree. of fineness to liberate anything like the entire amount of gold contained in the quartz, and every miner is also fully aware that any such process, by any machinery yet devised must necessarily be exceedingly slow.

Efforts are now being made to reach the required fineness by a direct process, and as to accomplish this the quartz must be reduced dry, a class of machinery has been introduced similar in its general construction to the "Smat Mills" in use iu the wheat growing counties of the Eestern States, which admit of an upward discharge, that can be so regulated that none hut the finest floating particles of dust can escape. One of these machines, the "Pond Crusher," manafactured at the Miners' Foundry, was recently illustrated in this paper. Another, now in use at the Pike's Peak mines, where it is known as the "Young America Quartz Crusher," instead of using revolving bammers, accomplishes the reduction by the simple velocity of its motion, the particles of quartz being struck are reduced to powider by "beaters," while suspended in the atmosphere. To accomplish this the beaters are made to move with a speed of from 12 to 15 hundred revolutions a miuute. This latter machine has been constructed in this city • by Goddard \& Co., at whose foundry patterns of the same can be seen. It is claimed that by these machines the quartz may be
erushed so fine as to need but very little reduction in the erushed so fine as to need but very little reduction in the pants, which, indeed, need only be used as amalgamators.
Both these machines are about to be submitted to practical tests on a large scale, the results of which will probably
fully develop their power, capacity and economy. Thus far new direction which is being given to our mining industry, their use hus been mainly experimental, but with results, cun be forned, than by passing through six or eight of our which give much reason to hope for the eventual success of principal foundries and noting the immense amount of mathe principle. Of course we shall not fail to note auy re-chinery now being prepared for these mines. sults for the benefit of our readers, as soon as they shall These developments, though outside of the limits of the transpire.

United States, are nevertheless as much condusive to the Much progress has also been made in improring the advancement and prosperity of this city as though the mines "stamps." Probably the best stamp battery which has yet were located within the bonaderies of California. All the been constructed is that made in this city by Goddard \& Co. wealth wh ch they will create, all the commerce and ivdusIt is made of wrought iron, durable, light, effective, and ea- trial interest which they will call into life, will centre in sily kept in order. The Ophir Company, at Washoe, has, San Francisco. and add directly or indirectly to the prosperthoroughly tested the value and economy of this battery by ity of each and all its inhabitants.
working it in connection with the ordinary wooden stamps, We propo-e to take up each foundry, separately, and enand have decided to adop it to the exclusion of the wooden ones. It discharges upon all sides, an arrangement which adds greatly to its effectiveuess. This battery may be seen and examined at Goddard \& Co's Foundry, on First Street Coas in this city.

## OUR MECHANICAL INTERESTS.

The late extraordinary mineral developments on the Eastern Slope, the ivcreased attention paid to the quartz mining interest, everywhcre, throughout the State, and the renewed attention now being given to the mines of Sonora and Lower California, are adding vastly to the business of the Foundries and Machine Shops of this city, and to mechanical industry generally. The continuous demand for machinery for new mines, and for increase and renewal of machinery on old ones are compelling our foundries, in many cases to enlarge their area of business, and to add many additional hands and much machinery to their mechanical forces. Go where you may about the great work shops of this city, you will find evidences of most unparalleled prosperity meeting you upon every band. The air of Front street and the lower portion of market, in particular, is resonant with the noisy din of the hammer and chisel of lath and anvil, while the sinews of iron and steel, moved by the untiring energy of steam, are constantly being brought into requisition as adjuncts to human labor. Thanks to the energy and enterprise of San Francisco mechanies and capitalists, our State is now fully redeemed from the thraldom of foreign dependence, and our miners and others are supplied with better machinery than could be obtained from the East, inasmuch as our mechanics and inventors have carefully studied and fully understand the peculiar necessities of the country.
A more intelligent and energetic class of mechanics cannot be found in the world than are now concentrated in this city. Being desirous to gain some idea of what is being done by our foundrymen and boiler makers, and make brief mention of the same in the columns of the Press, we took a hurried walk, a few days since through some of the principal shops, and were not a little astonished to note the magpaies render its permaneot 1ssue, in pampblet form, as has two or The recent mining operations and解 demands for machinery from our founded vastly to the likely to mislead as otherwise. Oar perre demands for machinery from our foundries and machine much more value in its present shape, corrected at regular shops. No better idea of the magnitude and extent of this intervals.

## THE HUMBOLD MINES.

Uniontille, Marci 25, 1863.
Mr. Edrror : Perhaps a few lines about our country would not be amiss. We have cold airy weather and the mountains are covered with suow, but nothing hinders the sturdy, iadustrious miner from driving his tunnel. Ere long we will astovish the world with our rich mineral. A few Californians, with small capital hare arrived among us and some purchases have been made. I will now give you- the names, prospects, and amount of labor done on some of our most important ledges.

## Prince Royal District.

This District is situated on Prince Royal Cañon, at the extreme northern end of the Humboldt mountain, and has many very important ledges ; among them are the King, and Daniel Websser. Tunnels are being run to both of these ledges and shafts have been suok on them-in the King ledge, to fhe dopth of 35 feet. Tons of good rich mineral are lying by the side of the shaft. These ledges are both large and well defined. I thiuk the King is second to no ledge in the Territory. It is about five or six feet wide and there is but lit le of the rock, which does not show mineral. On the opposite side of the hill three ledges are located, namely : Newton, Salust, and Colthurst. A tunnel is in progress to all three, and now run in solid rock one hundred and fifty f-et. They have run across several rich spurs and are now into the casing of the Newton. The owners of the ledges consider the numerous spurs alone, sufficient inducement to put up a mill and work the rock; the ledge is large and well defined, having mineral streaks traversing the rock. Near the latter, is to be seen the Mark Anthony, Alsop, and Socrates. One tunnel is being run for the three ledges, and is in abuat 100 feet. No ledge is yet struck by this tunnel, but the ledges have been opened and a great quantity of argenifierous galena bas been taken out, especially from the Mark Anthony. In one place I saw where they had run an open cut 15 or 20 feet across numerous spurs of pure mineral with a prospect of pleaty more ahead. There appeared to be a solid mass of quartz, as far as the cut was run. Assays of all, or nearly all of this galena, prove it to be rieh in gold as well as silver. The Prince Royal, American, and Yankee Blade are along the Fast Bank of Prince Royal Cañon. Two or three tunuels bave been run, one 80 feet and the other about 50 feet, for the purpose of developing these ledges. 'The Prince Royal tunnel is a little past the perpendicular from the croppings of the ledge. This ledge is valued very highly. It shows plenty of fine mineral, but is not very wide, perhaps does not exceed three feet. Two mill seats have been located near the mouth of the tunnel. Pensylvania, Napoleon, and Lilty, are the the first nearest the Canon on the opposite side of the mountain. Tunnels are ranning to all, and they are all truly very fine ledges, especially the Napoleon, and Peunsylvania-narrow but very rich both in gold and silver. The Napoleon can be traced for over a mile. On this mountain are to be found the Washington, Honey and Lacindarich and well defined ledges, and from the quantity of mineral they possess I should judge they are not much inferior to any of the former ledges. Last but not least, stands the Fort Pitt. It is situated in the eastern portion of this district and is 4 to 6 feet wide and I never saw a piece of the rock but that contained mineral. It is now considered the equal of the Sheba or Mammoth, being on the same range north, but I consider it superior to either of them and believe it will furnish many a man a "home ticket." There are three cmpanies, on tbis ledge and $I$ do not think there is any choice in them, one is about as good as another. The ledge is easily tunneled as the mountain is abrupt. A plenty of wood is right about the vicinity of this leage, and water sufficient for steam purposes. I know of no district or place more suitable for a mill than this Ravine at this lode. Several 'very rich ledges have recently been found on this range. Among them is the Tetna. It is equally as large as the Norton and has as fine miueral in the croppings as is generally found 50 feet below the surface. We come now to speak of the

## Santa Clara District.

This is a small district, but a very rich one. The Magna Charta stands number one in this district. It is a well defined ledge and contaius much very fine mineral, and is considered
a continuation of the Sheba Norch. I can simply say that it ranks second to noue in these mounaius and as suon as The Wyoming, considered a continuation of the Marnmoth, is truly a favorite leige, the mineral is of finer quality, if anything, than the Magna Charta. It is a bold well detined ledge aud held very high by the owners. The Kenlucky is another favorite ledge of this district, contains plenty of mineral but not of quite so fine a quality. The Butte is well known to you all as being a very rich, small ledge. Tunnels are being run to all these ledges and much money has been expended on them, besides a great deal of labor, and I am certain this summer will prove this one of the richest distriets in Humboldt Co. There are many other ledges here that are worth noting but I will defer the mention of then uutil my next letter.
M.

## THE PIKE'S PEAK QUARTZ MINES.

A correspondent of the Territorial Enterprise, is giving some very interesting accounts from the Pike's Peak coun try, some of which we have already copied. We give further extracts from his correspondence, to-day. We have taken the liberty to rearrange some of the paragraphs.

## pectliarities of the nines.

The Pike's Peak ores contain no quartz. They are iron pyrites more or less mixed with copper pyrites, lead, antimony, etc. The croppings of the leads are a kind of brown granite, containing some quartz and a considerable amount of iron. On sinking upon this, however, veinstone of any kind is not found. The lead is a simple crevice in the gran-
ite bed-rock filled with a mass of pyrites. Free gold is ite bed-rock filled with a mass of pyrites. Free gold is
sometimes found in the quartzose granite forming the cropsometimes found in the quartzose granite forming the crop-
pings, but is never seen in the ore itself. I was shown pieces of pure granite, quite rich in free gold, of a beautilully bright yellow color. I saw but one or two specimens of pure quartz in which gold was to be seen., The veins of pyrites run in a northeast and southwest direction. There are due north and south. These have never been prospected to any depth. The miners don't like them. They don't want quartz-iron is what 1 hey are after.

When these mines were first worked, the miners supposed When the quartz gave out and the iron came in, that their mines were ruined. 'then they all, in one grand chorus cursed the iron; now they curse the quartz, aad hope to get down to where there is nothing but iron. While in Central
City I was told that when the Gregory lead was first turued to iron, many supposed the country gone to the dogs. The owners as well as the principal business men of the 'rerritory were greatly alarmed. The Gregory then was and still
is, the leadıng mine in the country. If it petered it was is, the leading mine in the country. If it petered it was
like the Ophir fizzling, or Gold Hill giving out-all other leads in the 'Territory would be counted as naught. To save the lead and the country it was proposed to raise $\$ 1200 \mathrm{by}$ subscription to enable the company to sink through their
iron. The money was raised and the work done. My informant was one of the subscribers to this fund, and be laughed heartily when he told me that it was soon discovered that the iron was richer than anything they had yeffound in their mine. They had raised twelve hundred dollars to en-
able the company to dig and hoist ore worth one hundred able the company to dig and
and fifty dollars to the ton.

## the ores

as seen at the mills, are wholly free from clay or dirt, being but a clear heap of mineral. The ore is generally of a dark gray color, with yellow, shining pyrites visible on its surface, and often showing many bright rainbow tints, such as red, blue, green and yellow. I do not doubt but the ores of many mines in Colorado contain a considerable per cent. of silver. The American Flag and Kentucky, sitnated near Central City, present much the same appearance as the Sheba and other ores from the Humboldt mines. None of the mills at present in operation in the Territory would save anything but native silver. I saw ores from clear creek County, south of Central City, from a lead called the Whale, which were principaliy antimony, and might contain considerable
percentage of silver. I was told iliat ores of this naturepercentage of silver. I was told that ores of this naturequite common on the west side of the mountains, but were not much liked by miners, leads in which iron predominates being more sought after.
The leads are not so wide as with us, generally but from two to six feet; but a few are much wider. In every case
the ore of a mine becomes rich as the mine increases in the ore of a mine becomes rich as the mine increases in
depth; this was told me by everybody, and 1 could find no person who knew of a single exception to this rule. What everbody says must be true; therefore, all the Pike's $P_{\text {talk }}$ folls haro to do is to go down deep enough and all their mines will pay. The country is full of leads, but very few of them are worked-only scratched over.
peculiar mode of measuring tie ores.
A cord of ore weighs from five to eight tons, owing to the
nature of the ore. Ore from near the surface, containing
more or less blossom rock, is more or less blossom rock, is geterally considered higher
than that from a greater depth, containiog little rock. The than that from a greater depth, containing little rock. 'The
awkward plan of calculating and measuring their ores by the cord, instead of the ton, has done much to hurt the country. It has kept the miners and capitalists of California and Washoe in the dark as to the richness of the Pike's Peak mines. The papers of Colorado might just as well
tell the mining world that they bad ores paying ten dollars per basketfull as to say that the Bobtail pays thirteen per cord. People know that there is a great differeace in the weight of rock-a great difference in that from the same of ore crushed to obtain the sum mentioned, and not knowsing, are apt to throw aside the Colorado papers and think no more of the Pike's Peak mines, Assayers find measuring
ores by the cord vervinconvenient, or they must not only ores by the cord verv inconvenient, or they must not only
weigh the sample tested, but find out what part of a cord it is-this, an assayer tofd me, was generally ascertained by shrewd guessing. Ores are all hauled by the cord. Thus the man who has a rich lead, which is generally nearl
iron, and very heavy, gets his ore han iron, and very heavy, gets his ore han ed at the same price as that paid by the man who is just openingr his mine and has
not yet got down to the rich heary rock. It is also crushed by the curd, and a cord of the rich and heavy rock is crush ed just as cheapas the poor and light ores. Were these light ores hauled and crushed by the ton, the saving in ain hundred toas mignt make the mine a paying institution its owners, instead of a losing one, as often happens. few pairs of large scales erected in convenient places wo soon effect the desired change, and make the doings of our Pike's Peak friends intelligible in other parts of the mining world.
The price charged per cord for crushing is fifty dollars ten dullars per ton, calling a cord five tons, or eight dollars and two bits per ton, counting eight tons to the cord. 'This leaves a very handsome profit to the owner of the ore wher
the cost of digging is not too great. The ore canot be dug. out with pieks, however, as is geat. The ore cannot the case with but every pound must be blasted out.

## mining laws.

When a miner has found and recorded a lead it is his to all eternity. Glorious for lazy miners, but bad for the pro gress of the country. A man may locate fifty or a hundrev hims, then set down and wait for somebody t.o strike som hing rich in the leads on which he owns. This is the plar
of development chosen by the majority of claim-holders) of development chosen by the majority of claim-holders,
One hundred feet ona lead is a claim-that is, one huadrec feet square, and if a lead pitches out of this square it belongo to the man whose square it enters. But, in general, the ule, takes his clain by himself-is himself the company ano rule, takes his clain by himsel-is himself the company ana
the company's mother. There should be some time fixe for the expiration of the location. T'here are doubtless inany very grood clams standing recorded in the names of personi
who have got been in the country for vears : according th who have not been in the country for years; according be liable to be driven off by the first locator, should he hea that something good had been found on his old claim.

## mills of pike's penk.

There are no large or very custly mills in the Pike's Pea ines. Their best mills are such as could be built at a cos mines. Their best mills are such as could be built at a cos contain but little machinery-nothing but the stamps crushing, and copper plates and blankets in slaices for saviv the gold. They do not even use the shaking.tables commo in the old-fashioned California mills. Nearly all the saved is caught on the copper plates. Their stamps diculously light, weighing but from four to geven hun
pounds. Then the cams by which they are hoisted ar long that the stamps are obliged to take a laughably journey upward, when we consider the effect of this before coming down. It would appear to a Washoe man, watching one of these batteries, that the stami spent nearly all theirtime in going up, yet, if he watchi closely, he will find that every once-in-a-while one of comes down-comes down with a crash equal to that of
clasher of an old churn. All the mills, however, are such slow coaches. Many millmen have shortened cams, aud consequently therr stamps no longer go such lo journeys heavenward; but they nearly all retain, believe. and swear by their light stamps. A row of batteries twenty, forty or eighly stamps, each stamp weighing a tho sand pounds, would frighten them, especialy if they can down as frequently as they do in our Washoe mills. Noa rastras or pans are ased in any of the Pike's Peak mill
that I saw or heard of, with one exception. The mills not save much over one third of the gold shown by assay be contained in the ores.

## richness of the mines.

They have, perhaps, twents leads paying one huadred d lars and upward per ton, many that pay from twenty to fifi
The Gregory, Gregory Extension and Bobtail are about t best paying leads at present, though there are a dozen or ers nearly as rich in the same veighborhood. These " pay from five hundred to fifteen hundred dullars per cord, from one quarter to one fifth that amount per ton. Assas
madelong since, have shown that a large number of the vel

## MINING AND SCIENTIFIC PRESS.

One by one the mill owners are getting their heads above ater, ibid wo may soon expect to see I'ike's Peak one of (1) must flumisning minin:s countics of the world. The me is now near at hathd when the inineral wealth of the potry will b) properly estimated. Men of capital will pen come in and iuvest in the mines. From all I comble arn, there is an manensas scope of mineral country stretch zaway nurih. south ind west of the Central City mines, ach has beou littlo prospected, and that only by persons it the lonk-out for iron. Native tin has heen foum in tine of the westorn counties by miners when panning for

This was supposed by them to be metalic silver, and a time a silver fever raged in that section.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable ineral deposits, other than gold, in almost every section of he State, which have of late been made, it is but reasonalo to suppose that prospecting even in California, has but ist commenced. The simplest and most universal of all rtaliferous deposits is gold. It rarely occurs in any othe rm than that of "free gold" which is readily discernable to e naked eye. An examination of any rock or earth for fold is an extremely simple process. If its prespnce is susected in alluvium, the simple washing of that alluvium in a an is an invariable test. If in rock of any description fral rock pounded fine in a mortar and washed, in the sane panner as alluvium, will usually expose its gold to the na ded eye, if there is any there in paying quantity. The only sceptions, are where the gold is contained in iron pyrites, - copper pyrites containing also iron. In either of the vo latter cases the presenre of gold may be readily ascerfined by placing the pyrites in any suitable vessel and - eeping the contents at a moderate heat for from four to six ours, with frequent stirrings, by which means the sulphu ill be evaporated, and the copper, if any is preseut, chang. 1 to a dull red col.rr, and the gold retaining its natural aprarance, on subjecting the whole to the usual panning rocess, may be readily seen by the naked eye.
Not so with other metals. Silver, copper, zinc, nickel, ad many others appear in such a great variety of metalliffous forms as generally to defy all but the most practical nd scientific eye. No description of these ores can be ritten which will afford any very important aid to the inxperienced in making explorations. Alter reading depriptions, however, and carefully examining the specimen escribed, the explorer may go out and search with some deree of confidence and intelligence. A study of the char cteristics of the sulphurat ores alone, would lead an ex lorer to pass over, entirely unnoticed, the rechest varieties f the ores known as Chlorides or Horn Silver, which, from 10 facility with which they may be worked, and their usual chuess, are generally considered the most valuable of silver

There is much reason to believe that this variety o ilver ore will be extensively found in all the volcanic reions of this State. So with many other ores.
Considering the great difficulty, in the present lack of abinet collections, and other means of instruction, to acuire a practical minerallogical and geological education in his State, and desirous to aid, to our fullest capacity, the levelopment of our mineral resources, we hereby make he offer to miners, prospectors and all others, who in their ravels or explorations moy come acruss sjecimens having The appearance of rarity or value, to carefu'ly examine and pronounce upon the same, free of clarge, as to their charleteristics, value, etc., whenever any such specimens are prought or sent to this office free of cost to us. We have Aready been called upon in many such cases, and we shall t all times be willing to give our attention to any such re uests which may be presented to us.
Oin olbject is to furnish the miners of California with ev ry class of information which slall be valuable to thom in
the progress of thwir calling and in the developent of the minnolal resturees of the statl, and we know of no way in which wet can divote a prortion of our time more to the interests of miners than in the manuer here proposal. The only equivalent we ask is that they shall sh what they reasonably cun to sustain and improve tho paper devoted exlusively to their interests.
In carrying out the plan we propose, every miner and prospector should be at all times on the lookvut for any new mineral. I'ne ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusuul appertrance in conformation, color or other characteristic, attention shoulh at once be given to it. There is scarcey a piece of quartz or rock of a quartzoze nature, which presents any uncommon nupearance in texture or color that has not been thus modified hy the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should bo carefully examined "in place." and if the cause of its peculiarity is not evident and readily seen, it should not bo passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issuea series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notic of the California prospector; and we have the promise also, at an early day-probably within a week or two-of a series of articles under the head of "Tre Mr ner's Laboratory," which will be prepared especially for this paper by one of the most skillful me'allurgists on this coast, and which will be found of great value to the mining public.

SAN FRANCISCO MINING NOTICES.

Assessments upon Mining Stocks have been levied as follows :-

Garabaldi-Assessment of $\$ 1$ per share, levied March 2nd.
Sutro--Assessment of $\$ 1$ per share, levied Feb. 23, payable March 23.
Silver Quartz Mill Co.-Assessment of 5 per cent. levied Feb. 22 payable March 28.

Napoleon (copper.)-Assessments of $\$ 3$ per share levied Mar. 3, payable in 30 days.
Golden Age-Assessment of one dollar per share levied Feb. 24, payable March 26.

Washoe Gold \& Silver-An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

## general notices.

Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

Subscribe. - Are you a miner and not a subscriber to the Minina and Scientific Press? If so, you are an annual loser of many times the price of \& year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanies, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, sou can fiud no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MrNing and \$cientific Press. We invite all to send us their names and four dollars, or twa dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, ou the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontue the paper afler being a constant read or of it for even that short period.

## MINING AND SCIENTIFIC PRESS.

The only mining, mecianiel and scientific PAPER ON THIS CONTINENT.
THIRD YEAR: VOLUME VI.-NEW ERRIES 1
A uow rolume of this extensively circulated paper commenced Sept. 11, 1862. It is iutended that ervery number slanil be replete with information concerbing Mining, Scientific, Mechanical and Industrinl purkuits, together
with several original engravings, of now ibventions, ete., prepared expressly for its columns.
This paper is devoted to the above purposes, together with the interests or Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the render: and it is the intumthon or the proprie tor to spare no paius or expense in makiug it equal in iuterost and valuable antion to any paper yet published.

## The Mining Interest!

Will find it of great waluo, as it will contrin all tha news apperlaining to Mining, the prices and eales of Miniug Stocke, yew inventions of Machincry adtured to tiat gurpose, and of every thing genorally that may be of service to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his insontion into notice, of ascertaining the progress of invention in this and otber countrues, and also of receiving any information that may be necessary in outaining his patent, the preprietor having had great experience as a
Patent Agent, together with facilities at Washington that enable him to ob ain Patents with dispatch.

## The Mechanic and Manufacturer !

Will be greatly benefitted by its perusal, as each number will contan sers eral original engravings of new machines and insentions, together with y large amount of realling matter appertaining therets. We are constantle shall contiuue to extract whaterer may be of bencfit or interest to ou-

To Chemists, Architects, Millurights and Farmers \& This journal will be invaluable. All new discnveries in Chemistry will be given, matd a large amount of information of cratservers Archutcts and dilwrights win bo foum in our cone given of agricultural implements, and the forming interest generally will be amply discussed.

## Terms.

To mall subscribers :-Four Dollars per annum Club Fates.
Five Copies for Six Montes, \$8.
Ten Copies for Six Months, $\$ 16$
Ten Copies for Twelve Months, $\$ 30$
Fifteen Copies for Twelve Mouths, $\$ 44$.
For all clubs of Twenty and over, the yearly subscription is only $\$ 280$
For all clubs of Twenty and over, the yearly subscription is only $\$ 280$
Nnmes call be sent in at different times and from diffrent Post-ofices Specimen copies will be sent gratis to any part of the country.

## MINING PROGRESS IN ESMERALDA.

From the local papers and from private advices, we notice that mining operatious in Esmeralda, aud that portion of the Eastern slope, iucluded in Mono County and the eastern section of Thlare, are being pushed with much vigor aud energy. The mostactive effiorts are being made tu properly develop the mines, und render actual the suppositious values now represented upon the stock issues of the Miuing Companies of that regiou. We subjoin a few remarks collected from various reliable sources:

The Aurora Times speaks or a bar of gold and silver, the product of $91 / 2$ tons of rock and boulders taken from the surlace of Mr. Preble's clam on Silver Hill. The bar as sajed $\$ 2932$ in gold, and $\$ 35732$ in silver.

The Urul Company are rigorously executing the work up. on their lode, located upon Last Chance Hill. Their stock at last dates was held firmly at $\$ 525$ @ \$j500.

The Bamboo are pushing ahead with their work night and day, and taking out rich ore, which is being crushed at Belden \& Gregory's mill.
The Antelope is taking out better paying ore than ever. The Star of April 4th speaks of the rock which was then being raised as showing mach gold and streaked with blue veins of silver sulphurets. We see co reasou why the stock of this company should have depreciated of Jate in this city. It was sold at the Esmeralda Stock Board on the loth iust. for $\$ 400$, since which time it has ranged in this city from $\$ 300$ to $\$ 340$. This mine is evidently improving with its depth. "There are two shafts now being sunk upon the mine. This Company crushes its own rock, in an 18 stamp mill, with 16 amalgamating pans.
The Jennie Johnston, located between the Wide West and Garabaldi, is now being opened. The parties engaged in sinking the shaft are taking out rock which shows much free gold.
The Rose Dale, the Manning, Spring Valley \& Magnet consolidation, are also in progress of active development. The latter named company is lucated but a few yards distant from the Wide West.
The Locomotive, on Silver Hill is tarning out rich rock. Free gold and silver sulphurets are seen profusely in the rock. The shaft is now down about 100 feet and the rock is represented as appearing equally as rich as that from the Utah.
The Lady Jane, next adjoining the Locomotive, is also turuing out very fine looking rock, plentifully sprinkled with sulphrurets of silver. Its close proximity to the Antelope and Utah and other rich claims, aside from its actual developments warrants the belief that this ground will soon become very valuable.
The quartz mills in this region are enumerated as follows in the Aurora Times :-
The Union. Antelope and Brodie, in good order and running. The Wide West (new) also running and the Spriug Valley. The Winter's mill, up to very recently in good order and running constantly.
The following are not running-most of them being under repairs-but will be ready to resume work in a short time : Moses, Wide West old mill, Napa, Gibbons, Tucker \& Stark.

Mr. Fogus of Sacramento, contemplates the erection of a new mill. The material and machinery are on the way, and expected soon to arrive. Mills are needed, and those of the very best and latest improved apparatus atlached for saving the precious metals. The rock is here which contains sufficient gold and silver to insure large profits to the capital and labor engaged.
The Wide West, accorcing to the Star, located on Last Clance Hill is being worked night and day. Their new mill is working finely. It has 20 stamps and 40 pans. Preparations are being made for the erection of additional buildings for the accomodation of settling tanks aud furnaces.
The Pond Company at latest dates were sinking an air shaft for veutilating purposes. The rock from this mine is crushed at the Union mill.

The Fallstaff are sinking a slaft on their claims, 100 feet deep. The Silver Hill Consolidation have 75 tons of rock out.
The Bright Star, or Middle Hill, have sunk a shaft to the depth of 210 feet, at which they commenced drifting for
their lode. The 'Tiger is down 109 feet and have 75 tons of rock out. The Strawberry have a shaft down 100 feet and are on the ledge with good indications.
The Climax have a shaft down to their ledge, which is 8 feet inside at the point of intersection. The Hanson, on Last Chance Hill are down 65 feet, with a good ledge at the bottom of the shaft, and rock said to bear much resem. blance to the Ophir. Work is being actively prosecuted in numerous other claims, from which importaut developments may soon be expected. The miners of Esmeralda have adopted the right method of bringing their mines into no-tice-by thoroughly developing their values. Speculative mining will not build up any place permanently.
The Bulietin's Esmeralda correspondent of April 13th says :-
The new Wide West mill has at last started, and for completeness of machinery and general success, it is unqualled in the district. The mine looks magnificent and is rolling out tons and tons of the richest kind of ore. The Antelope mill is running and the rock yielding largely. The Union mill still coutinues on Poud rock, with splendid suc-cess-the last clean up yielded over $\$ 100$ a ton. Gregory's mill is crushing Suubeam. Bodie's mill is still runuing on Budie rock. All property in general is looking up, in the face of thousands of tons of quartz all stuck up, waiting fer a turn. A new mill said to be a very fine one, is on the way here, belonging to a Mr. Fogus, late of Sacramento. He has a small battery atlached to the main ones, calculated to crush a few hundred pounds of rock, and from that to judge of the value of any large lot sought to be worked by any
company or offered for sale to the mill. The idea is an excompany or offered for sale to the mill. The idea is an excellent one and should be adopted by all mill men of the district.
The Winters mill is said to have passed intc the hauds of the Real Del Monte Consolidation.
Work is going on at a great rate all over the hills, and incorporations are the order of the day. The superintendency of the Bambos has changed hands, Mr. Kyle taking the place of Dr. Howard. The change is expected to be productive of great benefit to the company and shareholders,
as the new superintendent is one of the most thorough, as the new superintendent is one of the most thorough, prac-
tical miners in the country. tical miners in the country.
a contract is being let on
A contract is being let on the Young Winnemucca, for a tuunel of 700 feat, to tap the ledge 350 feet deep. The company has taken up a mill site near the proposed commencemeut of the proposed tunnel, and they will nu doubt get the water needed fom the tuanel, as the shaft at 60 teet depth has an abundince.

## PROJECTED NEW PUBLIC EDIFICE.

There are now six Temperance organizations in this city which pay an argragate of $\$ 132$ per month for rent. We understand that it has been proposed to erect a building, in some couvenient locality, fiuishing off the lower floor for stores, which it is supposed will let for a sum sufficient to pay a fair rate of interest on the entire property, thus securing a hall, rent free, to the several societies. An architect has already prepared a design well calculated for such a structure, and we understand that there will be no difficulty in procuring the necessary amount of funds, as soon as a suitable lot can be found.
We believe the Odd Fellows put up their Hall or Kearney street, on this plan, and we understand it works fully as well as anticipated. Money can now be had at a yery low rale of interest. Indeed a large amount might be readily raised in the city by voluntary contributions in aid of the undertaking. Many, who never have, and probably never will unite with or take an active part in any temperance organization, are, nevertheless, free to acknowledge the great benefit derived therefrom by commanity at large, and are not only willing but anxious to do something, pecuniarily, for their aid. The donations from such sources would probably be amply sufficient to make such an advance on the property as would render the balance of indebtedness perfectly secure at the lowest rate of interest-say one or one and a quarter per cent. We trust the temperance people will be able to mature some plan for building on this basis. It would have a tendency to unite more closely the friends of the cause, and to give permanence and stability to the several organizations.

Apponntarents.-Professor Whitney, the State Geologist, has been named as one of the corporators in the Act recently passed by Congress incorporating the National Academy of Sciences. The first meeting of the Academy is proposed to be held in New York. W. H. Brewer also of the Califoruia Survey, has been appoiated to the Professorship of Natural Scieuces in the College of California.

Homboldt Claims are beginning to be more favorably considered than heretofore, in this city, and a large amount of capital is finding its way into the "feet" of that region. The Shéba and other leading Humboldt stocks are be-ginning to be enquired for.
We had the pleasure, a few days since, of meeting our friend Charles Barber, who has just returned trom that, res gion, well stocked with "feet" of the most approved quality. We bade him adieu, about one year ago, as he started out turer into those distant rearions, We we pow hopeful adven turer into those distant regions. We dow have the pleaswill to day enable him to "bauk" a goodly fortune for any man. We rejoice in his prosperity, and cite it as but one of the numerous instances of good fortune which this wonderful country is daily developing.
Mr. Barber brings most encouraging-accounts from the Humboldt mnes and has communicated much interesting and valuable information with regard to them, which we shall communicate to our readers in future numbers of the Press.

Consolidated Board of Broeers.-The Second and Third Board of Brokers of this city effected a consolidation, last Thurgday afternoon, and elected the following ofticers: President, Samuel Purdy ; Vice-President, J. D. Stevensonj Secretary, J. H. Gager ; Treasurer, J. D. Mathewson; Ser. geant-at-Arms, C. Watson. 'The initiation fee is fixed at $\$ 100$. The Board now numbers 97 members, and meets daily at 13.2 o'clock P. x.

Many people consider the world as the worm does the interior of a nut-simply a place in which to feed and grow fat.

The sales at the N. Y. Stock Exchange Board for the week ending March 1st a mounted to $\$ 9,209,000$.

## VIRGINIA CITY STOCK LIST.

Corrected for the Mining and Sciuntiac Pross, Friday, April o Bld.
Virgina Mining Distri

## WASHOE STOCK REMARES.

For the Week eudiug April II th, 1863
Judging from the limited reports for the week ending with the present
date, aud from uther indications we iufer that tho stock market in Virgiaia city hus been somewhut sluggisll for the past six days. On Tuosday a terrible storm of wind and driving snow bept the streets pretty clear of pedestriuns, and uppeared to put a pretty ellectual check ou traveactions of all kids. The absence also of nuy specinl excitement or "big strike" no
doubrproduced consideruble effect on the matket. The Euterprise reporter of Frisuay remarks wat the brokers seem to enjoy the apathy with much rel-
竍 ish, conscions that it must be of yhort duration. The bukiness hours of
the Boards were on that day duvoted to amusing assays at further deprossions, without a disposition even to fill orders or dispuese of stucks to ready purchasers. This tumporary inuction will be followed by unwouted animatiou, withoul a doubl, and that, too, within is fer days. The developments ovurywhere belug made must lead to an excitement in the stock market,
The Cscevt, on Cedar Hill, appears to have farnished the ouly item of
reported im alght. As a comecquance the stuck has advanced sondowhat, and in reperted to have beren muidat at $\$ 0$.
Thy Latucers Corupaty have struck mimeatome of a valuable lodge, and

 is shown from works two lutes hur the of Virginia, fand the verimble Cora

 OL Wedteestay wo atharen wore mathet at lead thats Shio.
 is dull at thesu Hgures; thrty foet sulh ou Shondity at est.
Vated Shates Tunnul shater aro adyancing and and be quoled at 3750 (9) 800 per quartor thare ut $\$ 16,000$, with a hatir teratud aud upward tondency. Huruside fe untroly iLachye, and is in inarket at $\$ 10$ (a) 42 60, without takers.
Nurton is salcable at $\$ 20$ @ 22 50, with littlo olloring at leas than $\$ 26$ © 760
Belvidere in marketuble at $\$ 20$, but higher bids aro domanded.
Thu Ifanaratee, a clatin finmediately back or the Beach \& loaxton, is in requeshat $\$ 10$, to $t l l$ orders from below it in generally held for higher ratus. It is a san Fraucisco sheorpormition.
Bultic is aa request at $\$ 16$ @ I 8 , at whicu rates two or three huvdred feet bave cluyged lands durmg the weok.
Eurokit, Gold Hill, in iu request at an udvauco, in consequence of developneuts. We quate it at \$45.
The United States Mining Companay wbo hold quite a number of parallel iedgen just to tho uorth of the Ophir nuve ther tunnel now it 1650 feet and are uxpucting every day to atribo the Cumstuck ledge. This compray own some tive or six parullel ledges. Thoir stuck whicts is now worth atout $\$ 10$ in the san Frauciseu market, will probably go up to a much greator tiguro as soou as tiseir tumel roaches the ledge. Among other sharen teuding upward in thu Yirginfu District, we may inontion the Fairview, Bachauans. Morty, Uaited states, Birdsall, Utah, etc., although no very decided advance has ac curred.
Goid hill blares are in high faver and many of them aro advanolng rapidly. Leon is galeable at $\$ 40$, Princess at $\$ 40$, Overmau at $\$ 45$, Belcher at $\$ 160$, Koh. i -noor at $\$ 150$, Yolo at $\$ 20$, Dunn ut $\$ 3$, etc.

## ESMERALDA stuck LIST.

traneactiuns of the week.
Bunker Hill, Bodie District- 75 at $\$ 15$.
Willow springe- 65 at $\$ 40$.
Magnet \& Spriur Valley- 30 at $\$ 20$.
Rebecca- 10 at $\$ 7 / 2$
Silver Hill, Bodie District-100, at private rates.

## WHEELER'S

Amalgamating and Separating Pans.

It is acknowledged by all who hare examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalga mating purposes to any other in ure.
The mnst important principle connected with the ope-
ration of these Pans is the separation of the trituratius process from th: $t$ of extracting the amaigam from th sand. The chief canse of lass of the precions metals ar
sef from the paesing off of the same in combination wit cleaning up. By the introduction of trituration, and in
of f. 11 arating Pan of llow the trituration this loss is entirely aroided. I quickeilrer, and bence none of the precious metals.

## TO CITX SUBSCRIBERS

The experience of the past four or five monthe has proved the impossibility of a regular and prompt delivery of the Minina Press to city subscribers by any carrier, who has no other interest in his businers, than to simply get through his routes, and draw his weekly pay. So much complaint has been made, that we have concluded to adopt the universal custom in this city, of placing our routes in the hands of a carrier, whose interest in it shall be to increase instead of curtail them, and who, for such reason, will be very likely to attend faithfully and punctually to his duty. We have made this arrangement with a party upon whom both ourselves and our subscribers can rely. Many of our subscribers have already expressed the desire that we should adopt, in their cases, the usual custom of calling upon them monthIf for their subscriptions, and as it is desirous that the arrangement should be uniform, our carrier will call upon all others during the week, and such as are willing to become monthly subscribers can do so and settle with the carrier, for all arrearages. Our large and rapidly increasing city list renders it necessary that we should employ a man to devote his entire attention to it. We trust the arrangement will meet the approbation of our patrons.

Siliman's Journal.-We have received the March namber of the American Journal of Science and Arts, edited by B. Silliman, B. Silliman, Jr. and James D. Dana. This publication has now reached the 45th year of its existence, and is a standard work on all matters pertaining to science and arts-the only Journal of the kind on the Continent. It is made up of original papers and abstracts of foreign dis. coveries in physical and chemical science, geology, mineral agy, metallurgy, natural history, etc. It is a matter of congratulation among men of science, everywhere, that this standard publication has been able to stand the pressure of this extraordinary epocb, and continue its regular appearance even alter it had been curtailed in circulation by the loss of a very large portion of its patrons who were dwellers of the Southern States. The number before us containe a valuable collection of papers, ombracing within their range nearly every department of science and arts. This work is published every other month, by Silliman \& Dana, at New Haven, Conn., for $\$ 5,00$ per year-each number containing 152 pages.

Remotals.-The office of the Lady Bryan G. \& S. Co. has bpen removed to 605 Sacramento Street.
M. G. Elmore, Mining Stock Broker, has removed his Office to No. 528 Montgomery St.

Tare "Supplement" to the News Letter, forgets to credit the Press with the article entitled "Amalgamating Gold and Silver by Electricity," which it copies.

Black Ink.-We have received a sample of "Pilkington's Black Ink," a very superior article and said to withstand the action of aeids. It can be purchased at the corner of Montgomery and California Sts.

## PROGRESS OF THE MINING INTEREST.

We continne our notices of mining progress in -various sections of the State und adjoining territories. It is only by consulting such facts as we here lay before our readers that persons can act with judgement in their investments in progressive mining stocks. In a dividend paying mine, all that a purchaser cares especiully for knowing is that the company is paying a regular percentage upon its capital stock. He then invests at a price per foot or share upon which the usual dividend will afford him a percentage which he considers an equivalent for the use of his money. He is a poor business man, who seeks nn investment in an unproductive mine, without first informing himself as to its condition and the progress which has been made in its development. We shall hereafter devote a large space in our columns, and whatever time may be necessary, to collect all attainable information which may properly come under this head. We intend to make such information as reliable as possible, and our readers by filing their papers will soon have in their possession every material fact connected with the progress and development of every mining company which has an office in this city, and so far and fast as we can obtain reliable data, we shall also report progress upon all other companies, wherever on the Pacific Coast they may be located, or wherever their official place of business may be. In obtaining this information, we shall, of course, as a general thing, be compelled to take for our authority the statements of others, and whenever any misstatement or omission may be noticed we shall esteem it a favor in any one who will call our atteution to it, and furnish us with the correct facts in the case.
virginta mines.
Burning Moscow.--This company is now employing about 20 men. They have a steam engine upon the ground for hoisting purposes, and the management of the mine has recently been placed in charge of a new Superintendent, Mr. Philip Deidesheimer, formerly Mining Engineer of the Ophir Co's mine. The mine is worked by an incline upon the vein, which yields good ore at a depth of about. 70 feet The prospects of the mine are such as to warrant a vigor ous prosecution of the work. Drifts are now being run for a thorough development of the mine.
White \& Murpay.-This Company has recently made arrangements for an immediate opening of the mine through the Latrobe tunnel.
Desert.-This Company, situated in the Flowery district near Virginia City, is not far from, and is supposed by nany to be an extension of the Lady Bryan. But little has been done toward its development until recently. The Company has now however taken the necessary steps for its development by running a tunnel, sinking a shaft, etc.
Lady Brynn.--Considerable attention has of late been directed to this mine in consequence, probably, of the appearance o some very rich ore in a new shaft which was being sunk upon the vein. The present condition of this mine is very clearly given in the following extract from the report of

Mr. Charles Bonner, Mining Engineer, to Mr. Teschemacher, President of the Company:-
"The general geological formation of the District is precisely similar to that of the Comstock vein. The outcrop of the vein is an immense mass of quartz, from 100 to 150 feet wide, of a good character, running in a northerly and southerly direction. The tumel has been driven through the vein at right angles to its course, and passes through a similar thickness of quartz to that at the out-crop. But the quality of the rock indicates that it will have to be followed to a greater depth before good results can be expected.
The shaft now being sunk where some rich ore was cut recently, is in the Western Lode, intersected by seams and bunches of quartz, some of which contain very rich ore. The quality of the ore discovered in the shaft is excellent, but limited in quantity-a proof of the existence of rich ore in the vein at increased de pths. The shaft now sunk is not at the place where the vein can be worked to advantage, and recommends a new shaft to be sunk in a westerly di. rection, to a depth of 1000 to 150 feet, at a point indicated by him to Mr. Owens, the Superintendent, and that an Engine, Pumps, and Working Gear, for hoisting rock, be im- 1 mediately provided-an expense undoubtedly warrauted from the present appearance of the vein."

## esmeralda mines.

Rip Van Winrle.-This Company is sinking a prospecting shaft, which, by last reports was down 35 feet. As soon as the ledge is reached prospecting operations will be commenced.
Bodie Bluff Consolidation.-This Company are actively engaged in developing their several ledges. By last reports their shaft on the new Mexican ledge had reached a depth of 125 feet-on the Isabella they were down 90 feet; a shaft had also been commenced on the Osceola. We shall speak more fully of this in our next issue.

The Bodie and Silvar Hill Consolidation Co. has been organized by a, consolidation of the Rising Sun, Grotto, El Dorado, and Climax Lodes. The Company has commenced operations on the several lodes, by tunnels and shafts.
The Jack Hays, Sam Patce, San Francisco and Tennessee Companies, are all recent Organizations in Esmeralda having their offices of business in this city. Active operations have been commenced upon each, by sinking shafts of suitable depths for an approximate development of them. We shall soon be able to report progress.

Willow Springs Extension, Middle Eill, are working their claim night and day and taking out ore said to be very rich.
Coso S.M. Co. This Company, whose lodes are located in Ooso District, have their mill about completed, also the road to their mine. In a short time the rock from their various ledges will be tested by a practioal working process.
slate range.

The Cafuga, Blue Ridge, Madison and San Francisco, all in the new Slate Range District, are in progress of de-

## VAT.UABLE ALLOYS.

Stuver Steel.-One part silver, 500 parts steel, necording to Farraday and Stodau. This alluy would be superior to the best steel. Steel also combines with other metals, such as nickel, platinum, magauese, \&e.

Copper and Antimony.--Seventy-five farts copper, and 25 parts autimony. This alloy is brittle lamellated, of a vivle: color, susceptible of a fine polish, and is more fusible than copper.
Bisyuth and Lead.-One part of bismuth, and 1 part of lead, a very tenacious alloy, melting at $165^{\circ}$ Centigrade equivaleat to $370^{\circ}$ Farenheit.
Two parts of lead to 1 part of bismuth gives an alloy which dilates powerfully at the time of cooling. (This pruperty makes it extremely suitable to all custings in which the greatest sharpness and finish are desirable.)

Brilliants of Fahlun.-Thus called, are made from 29 parts of tin, and 19 parts of lead. A very fusible and briliiaut alloy.

Tix and Zixc.-One part tin, and one part zinc, is almost as tenacious as brass, and molts at $460^{\circ}$ to $500^{\circ}$ Centigrade, $900^{\circ}$ Fahrenheit.

I'm and Iron.-These tro me'a's may be allosed in all proportions. 35 parts of tin to $5 \overline{5}$ parts of iros furm an alloy of a clear crystalline gray, and so brittle that it may be reducel to an impaprable powder.

Asti-Friction Metals.-Many use 9 and 10 parts tin to 1 part copper. A superior composition to either of the above is, 1 part copper, 1 part regulus of antimony, to 10 parts of tin. Melt the copper first, then add the antimony, with a small yortion of tin ; corer up the whole with charcoal for a short time prior to casting; add the remainder of the tin. The compositions are solely used for lining brass bearings.
Five Brazing Soldrr.-Twelse pounds of copper, 11 p unds of zinc flux with powdered brimstone.
A Neiv Guy Metal-James T. Ames, of Chicopee Mass., has received a contract to furnish two guns to the Navy Department, which shall be made of a composition of metal of his own invention. It has borne an explosive force of 80,000 pounds to the square inch.

Indian Steel.-The steel made in India is of such good quality that not only are Indian swords made froma $i t$, but the best of Persian swords likerrise; and it is believed that the vast monuments of ancient Egypt must have been cut with tools made of Indian steel, in respect to the hieroglyphics on the intensely hard porphry and syenite.

This Indian steel appears to be made from the magnetic oxide of iron. The ore is stamped to fragments, and the adherent quartz is separated by washing and sifting. The smelting is effected in the most primitive way; the furnace is built of clay, and not more than four or five feet high, the bellows is formed of two goatskins, with a bamboo nozzle, tipped with a clay tube at the end which is to be nearest the fire; the fuel is charcoal. The iron produced by the appliances is such as our manufacturers of steel would treat with little favor. but the Hindoo manages to obtain most excellent steel from it. The iron is heated to a slow red heat, and is beaten for a long tume with a stone hammer on a stone onvil, the Hindoos having an opinion that iron implements are injurious. To convert this hammereả inon into steel, it is broken into small pieces, and put into small crucibles with a little dry wood; the crucibles are stopped up with clay, and are putinto a furnace where they are entirely covered with charcoal. Ablast is then applied for two or three hours, the crucibles are removed, allowed to cool, broken and the metal is in a proper state to be fabricated into any desired form.

Whitewasf-This article as ordinarily made, rubs off the walls after it becomes dry, soiling clothes and everything coming in contact with ic. This mag be obriat d by slacking the lime in builiug water, stirring it meanwhile and applying after dissulving in water, white vitrol, (sulphate of ziuc.) in proportion of tour pounds to a barrel of whitewash, making it of the consistency of thick milk. The sulphate of zine will cause the whitewash to harden, and prevent the lime from rubbing off. A pound of white salt should also be put into it.

## NATURAL HISTORX.

A most importaut enterpris-important in a scientific ight-has heen recently undertaken by the friends of science in Nebraskit. A company has beeu formed under the name of Tue Rocky Mocythin Natural History Expedimon, to explore the Rncky Noutain region. Its originators are citizens of Nebraska, residiug on the border of civilization, and almost adjacent to the proposed field of exploration and research.
It is the determination of the expedition to wake complete colleciions of plants, dried and alive; seeds, cuttings and grasses; of birds of their skius and eggs; of shells and fossils ; of skins of large animals, their bones and skulls; insects, fishes, minerals, etc. The expedition possesses all the necessaries for collecting, curing, packing and transportation.
A Botanist, Naturalist, Geologist, and Taxidermist, will accompany the expedition, and make full and complete collections in their respective branches. There will be established in Nebraska City, a depot, where cullections will be forwarded, as soon as sufficient quantitics are collected for transportation. It is expected that the expedition will occupy thre jears, or until a thorughl reserach is made of the Territory namel. Sulseribers, aud those identifind with the expedition. will receive their specimens annuaily, from the depot at Nebraska City. The expense atteuding an outfit so complete as this will be, makes it necessary that they receive aid from subscribers. Those who remit $\$ 10$ whll receive a certificate of Membership and a collection. A Corresponding Secretary las been secured for the States, who will adrise the subscribers of the success of the expedition from time to time. The expedition is expected to start for the mountains about the first of June. 1863.

Remittances should be made in T'rensury Notes, by mail to R. O. Thompson, Secretary and Treasurer, Syracuse, Otoe County, Nebraska 'lerritory.

That there is a field of deep interest to the Botonist, Naturalist and Geologist, in the Rocky Mountain regions of North America, has been already demoustrated by the collection of rare Plants, Birds, Insects and Fossils, that have already found their way to civilization from that quarter.
The Natural History of the Rocky Mountains within the Territories of Utah, Colorado, and New Mexico, is yet but partially developed, and it is to be hoped that this expedition to fully explore that region will be eminently successful in placing its Natural History before the people of the United States, in so complete a record that Science will receive a lasting benefit therefrom.
Tire Harmis Lead at Bromn's Talley, about 10 miles east of Marysville, has been in active operation since Aug. last. The mill has all the modern improvements in machinery, and is paying at the rate of from $\$ 4,000$ to $\$ 6,000$ per month, above expenses. The entire property, we understand is owned by H. Harris, of Marysville. Quite a town has sprung up about the works and a neat church is soon to be erected, all through the enterprise and liberality, directly or indiractly, of Mr. Haris.

Pretertion of Dasip in Grousd Floors.-Until rec ently no provision was made to guard against the absorption of moisture in the foundation walls of a house; latte:ly, every working bricklayer knows that by the use of a single layer of slate (fixed in cement,) ever so little above the ground range of a foundation, the rise of damp in walls is repressed. What a catalogne of erils is avoided by this simple provision! The servants of an establishment are saved from all the penalties which damp walls are sure to entail upon the occupant of a basement story; all the aches to which the human constitution is subject are at once obviated; and apartments which, built on the, surface, were formerly damp some two or three feet upward, or if sunken only four feet below the level, were damp to the celling, are now perfectly dry and fit for sleeping-rooms.

A New Method of Exterminating Rats - A person being much troubled with rats, and being determined to get rid of them, tried evers possible plan but without success. A last he gut a lot of rats, and shut them in a cage; they deroured one another till ouly a single one was left. He then turned this one loose, who, excited with the blood of his fellow rats, and having become a genuine cannibal, killed and ate all the wild rats he could find on the premises.

## SUCCESSFULLY AT WORK.

The Lnudon "Pneumatic Dispatch Company" has commenced lorwarding mail-bags through its underground tubes. this euterprise is norel. 'The Pueumatic tubes which have been laid by the company extended from the Elaston Railway station to the Northeru District post office in Eversholt street, London, a distance of only about one third of a mile, but sufficient fur experimental purposes. The tube resembles an eliptical gas-main, thirty-three inches ligh by thirty inches wide, and is laid in oine feet lengths, at an average depth of aine feet below the street level. The joints are filled in with lead so as to be perfectly air-tight. Withiu this tube runs a wrought iron car, eight feet loug, weighing eightewt., and fitted with four wheels, each twenty iuches in diameter. At each end of the tube is a hollow iron wheel, working in an air tight box of twenty one feet in diameter, which is connected with a steam-engine of seventeen horse power. The wheel turns at a velocity of seventy or ninety miles an hour, when the air is drawn in thro' its hollow ceutre and thrown off from its_periphery with a force that gives a pressure of from five two seven ounces on the square incl. The iron cars io the tube present a surface of nearly five square feet to the blast, and are propelled at the rate of thirty miles an hour.
The entire cost of a line of five miles is estimated at $\$ 650,000$, and it is proposed to carry freight as well as mails through Loudon, at the cheap rate of a penny (two cents) a ton per mile. So far, the experiment is successful, and the results are very interesting and curious.

Red Ink.-Common red ink is made in the most simple manuer, by nixing common carmine with a suflicient quautity of aque ammouia to flow freely from the pen. Any person can maaufacture redink in a few hours by this meth od. A cheaper red ink may be made by boiling two ounces of Brazil wood for half an lour in a quart of water, then straining it and adding hale a drachm of the chloride of tin and one drachm of gunarabic. Such ink is used for ruling red lines on blank-books. Carmine ink does not affect steel pens like that made from Brazil wood; none but quill or gold pens, howerer, should ever be employell with red ink. Liquid Solferino (aniline red) also makes a good red ink.

Poor Prophets.-It is remarkable how many predictions of men of science, in regard to the practical utility of important discoveries, have signally failed of fulfilment. When Sir Walter Scott heard that it, was proposed to light streets with coal-gas, be said: "It can't be done; it's ouly the dream of a fanatic." Sir Humphrey Davg, the eminent chemist, said, in regard to the same thing: "It's all nonsense. You might ds well talk of lighting London with a slice of the moon, as to taik of lighting London with gas." When the subject of ocean steam navigation was first pro posed, Dr. Larlner demonstrated, as he supposed, by elaborate calculations. that the matter was practicully impossible. When Franklin announced the identity of lightning and electicity he was laughed at. When Morse proposed to send a telegraphic message between Washington and Baltimore, he was regarded as a fit subject for the lunatic asylum.

Here is a queer statement-but if true, a very important act for houselseepers :-
To Preserve Eggs.-Place half a dozen at a time into boiling water, or as many as you can lift out at once with a skimmer, and leave them in the water from five to six seeonds, and they will keep fresh for any length of time. This process coagulates a thin film of the white next the shell, and renders it impervious to the air, Whi ch is the cause of
the putrefactive stage,-the shell being porous, and by lay. ing a short time in one position, the jolk displaces the white and comes in contact with it and spoils.
Corporations in Mono Countr.--The Aurora Time: says; The number of Incorporations in that County, inclusive to the 1st inst., for Gold and Silver mining and othen purposes, numbered two hundred and forty-nine. Sines then other companies have been organized. The presen number is 267 .
Copper.-The excitement over new copper discoverie: still continues in every portion of the State.

LATEST FROM ESMERALDA.
We receive by private advices from Esmeralla most encouraking word with ryard to the mune in that Histrict The mines are very genarally improving as the workingo descend. Our correspondont writes" ds we gen down the poen mines are the exceptions," and adds. "The Wile We Mitl runs like a top-yon need not fear to speak well of this District, as to the mimes.

Smpassr of 'Imenscres:-The folluwity is the list of treasure shipped for the East per steamer Sunura of the 23 inst.:-

| ''o P'anama. | 27,600 00 |

As Oil Spasa has recoutly heen decorered in Colusa connty, on the foust lange, and a compray bats been formed in Marysville to thormally prospect and work the sume if it-hall prove as extansive assaticipatel. The spring is sitnated ahout a mile from simmon's IVut sulphar siprings.

## TO MINERS AND PROSPECTORS.

In view of the frequent acciclental discoreries of valuable mineral deposits, other than gold, in almost every section of the state, which have of late heen made, it is but reasonable to suppose that prospecting even in California, has but just commencel. The simplest and most universal of all metaliferuna deposits is gold. It. rarely uccurs in any other form than that of "free grold" whiel is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any deseription thal rock pounded fine in a mortar and washed, in the same manner as alluvium, will usuilly expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with freriaent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changod to a dull red colir, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the noked cye.

Nut so with other metals. Silver, copper, zine, nickel, and many others appear in sucla a great variety of metalliferous forms as generally to defy all but the most practical and scientific epe. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. Alter reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with fome de gree of confidence and intelligence $\mathbf{A}$ study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the nchest varieties of the ores known as Chlorides or Hurn Silver, which, from the facility with which they may be worked, and their usual richuess, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in their travels or explorations may come acruss specimens having the appearance of rarity or value, to carefu'ly examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.
Onr olyect is to furnish the mimers of California witle every class of information which shall be valuable to them in
the premeres of their mating and in the developent of the minemal resumers if the state, aml we know of no way in which wee canderote a prertion of our thene more to the internsts of miners that in the manns here prepused? The only erguisalent we ask is that they shati do what they re:aamably ean to sustath and improve the faper devoted exluaively to thair interests.
In carryine ont the plat we propose, every miner and prospectur slould he at all tumes on the loukut fon any new mineval. The ordinary rocks witir which the miner meets in his travels and labor, and which pussess no mineral value are usually well known. Whenever a rock presents any unusuul appearance in conformation, color or other characteristic, uttention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzozo nature, which presents any uucommon appearance in texture or color that has not been thus modified by the deposit or intrusion of sonte mineral substance. If such rock is found upon or near a vein of quart\% it slarould be curefully examined "in phace." and if the canso of its peenlarity is not evident and readily seen, it shonh not be passed carclessly by. There may be valus in it, althongh the guld may not shine there. We shall commence in our next issue a so ries of articles deseribing as accurately and as intelligilly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector; and we have the promise also, at an early day-probably within a week or tryo-of' a series of articles under the head of "Thae Minek's Labobatory," which will be preparel especially for this paper by one of the most skillful me'allurgists on this const, and which will be found of great value to the mining public.

## SAN FRANCISCO MINING NOTICES.

Assessments upon Mining Stocks have been levied as folows :-
Garabaldi.-Assessment of \$1 per share, levied March 2nd.
Sutro.-Assessment of $\$ 1$ per share, levied Feb. 23, payable March 23.
Silver Quartz Mill Co.-Assessment of 5 per cent. levied Feb. 23, payable March 28.
Napoleon (copper.)-Assessments of $\$ 3$ per share levied Mar. 3, payable in 30 days.
Golden Age-- Assessment of one dollar per share levied Feb. 24, payable March 26.
Washoe Gold \& Silver.-Anassessment of 2 per cent on capital stock was levied Feb. 16, payable Apr. 1.

## gener

Coso Silver Mining Co.-The Office of this Company bas been removed from the Stevensou House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

Subscribe.-Are you a miner and not a subscriber to the Mining and Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. In you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, yon can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understaud that it is sent to them for examination, and with the hope tbat it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxions to introduce the paper where it is not now known, we will, for the present, send the Press for three months eveu, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontue the paper after being a constant read-
ithining and \&rientific y|rcss.

## To Printers.

An Istrasst in one of the mont llourishatug and best mying Newfin fer onlees in the mometain ix olfered fur sate on casy arms. A rary of
 self in a grat bismess in one of the healthiest, most thriving and dehghtful mountain towas in the entato. For further information eryuire ne this nlice.

## MINING AND SCIENTIFIO PRESS.

THE ONLY MINLXG, MECHANICL AND SCIENTIFIC PAPEIR GN TMISCONTINENT.

## THited rear: volune vi.-new serifs

A new volume of this extenswely circulated paper conmenced fept. In,
1862. It is intended that ceveryumber shall he replete with information 1862. It is intended that overy number shall he replete with information wifh several or iginal engruvings, of new inyentions, etc., prepared expressly for its columbs. This phiper is levoted to ther above purposen, together with tho interesta of sciunce, Arts, Agriculture and Commerce, ami any general information
that may be of interest to the rember : and is is the intuntion of the propritor tosipnere no pams or expense in maing it equal su interest and valuablo iuformatiou to ithy daper y yt published.

## The Mining Interest I

Whll find it of great value, as it will contain all the news apperiatiling to Mining, the prices and sales of Mining Storks, hew inh ellitions of Machnery to the Miuer.

## The Inventor

Will find it an excellent medum for the purpose of bringing his invention into notice, of ascertaining the progrees of invention in this and other countries, and also obecting bis patent, the propritor having had great experienco as ab l'atent Aspont, together with lagilities at Washiogton that equblo him to ob ain yatents with dispatch.

## The Mechanic and Manufacturer !

Will be greatly bencfitted by its perual, as each number will contare seve eral orignal engrawings of new machinss and inventions, logether withy
large anozat of reading matter appertaining thereto. We are constintle large anoznt of reading matter appertaning thereto. We are constintle
recuiving the best scientige journals from anl quarters, from which wr recuil coltinue to extract whatever may be of beneft or interest to oureaders.

To Chemists, Architects, Millwrights and Farmers ! This journal will bo invalunhle. All new disenperies in Chemistry will be givelh, and a large amount of mormatimit of great serrice to Arehitects and
Nillwrights will bo found in sur columus. The Farmers and Planters will out bo weglected, engravings will be given of agrivultural mplements, and the farming interest gencrally will beamply discuased.

velopment by shafts, etc. The shatt on the former is down 50 feet.

Quite a number of Companies located in this region have receatly been orgauized iu San Francisco, and all are actively engaged in securing a propur development of their severmines.
The Sheba, which was one of the earliest and is perhaps the best known mine in this district, is rapidly gaining in public favor. The ore from this mine is of a nature which will not yield to any of the vaiious chenical processes now emploged in this country for the reduction of silver ores. It can only be reduced by a process of smelting. It consists chiefly of an Antimonial Sulphuret of Silver, which, until this discovery, has ever been considered a very rare mineral, and, which we believe, has hitherto been worked ouly in Lurope. The Sheba Company has 15 tons of ore now on its way to this city to be smelted here, with the view of fixing a per ton grade to which it may be assorted for the purpose of exportation for treatment in Europe. The lower tunael, which is being run by this company and which we have doscribed in previous numbers of the Press is now on the lead, and at a distance of 30 feet below the upper tunnel. The vein at this point is found equally as rich as in the upper tunnel. This new development has had the effect to cunsiderably enhance the price of stock in this market.
The Starligut has shipped tools, etc., to their mine and will immediately commence the work of its development.
I'me Estrella del Monte, tie Maneattan, the Cocerego, the Siegel and Annie Laura, late incurporatiunsia this city, are all being prospected by tunnels and shafts, and their stock will doubtless soon acquire value in the mariset.

## rese river.

Tre Reese Rrver Co.-This Company, the only location on Reese River, which has yet found its way to our mining table, is a consolidation of 16 different ludes, embraciug an aggregate of 7880 feet, divided in 1200 shares of $\$ 100$ each. The Company has taken up 640 acres of timber land, 63 of which lie directly on the River. This location is directly on the Overland Route. Wells, Fargo \& Co. have established on office in this neighborhod and a telegraph station is also about to be removed there. The Company's claims are made up as follows :-Little Giant 400 feet ; Nar tional 480 ; American Eagle 600 ; Sigel 500 ; Stanton 400 ; Fricsson 300 ; Pony Exteusiou 600 ; Lincoin 1600 ; Latham Extension 200; Overland 200; O'Neill 200; North Star 200; Oregon 200; Highland Mary 200; Black Rock 600 ; Cedar Hill 1200-T'otal number of feet 7880 . The Company is now unning a tunnel into Highland Mary, which at latest reports had progressed 190 feet. They will strike the ledge at a depth of about 400 feet. At 20 feet from the mouth of the tunnel they crossed a 15 inch lode which they think will pay well for working.

The Melones \& Stanyslaus Co., located in Calaveras County have recently struck ore of an extraordinary richness in a shaft at the depth of 35 feet. Some of this rock can be seen at the Company's Office, in Lucas \& Turner's Building. The specimens are aroong the finest which we have ever seen. The rock is of a cream color, and shows gold all through the mass. One of the specimens shows a profusion of sulphurets of silver. This mine is in process of rapid development.
The Alameda Coal Co. have their office in the same room with the Melones. This Company have eleven different veins or strata of coal included in their location. They are sinking a shaft, which has already reached a depth of 250 feet. They have some fine specimens of lignite at their office, which are indicative of a large vein, and which it is thought will improve as they go down, into a good quality of coal.
The Sneati \& Clay Gold Mine, recently opened, near Nevada City, appears to improve as the work upon the same progresses, surpassiug all expectations, and surprising even
the owners themselves. Developments, thus fir, seen to the owners themselves. Developments, thus fur, seem to
indicate that this will prove one of the richest mines in the State, and will bear favorable comparison with the best in Nevada Territory.
The Nevada Quartz Mining Co. makes the following favorable exhibit of their work for $1862 \& 3$.

|  | Tons cru-hed. | Ozs. Anal'm | $\checkmark$ alue. |
| :---: | :---: | :---: | :---: |
| 1861-2. | . .3,735 | 15,780 | \$60,333 |
| 1862-3. | . 4,785 | 17,655 | 67,305 |
|  | br califo | * SONORA. |  |

The Gobernadora S. M. Co., in San Antonio District,
Lower California, are now taking out rich ore.
The Mina Prieta Co., located in Sonora, Mexico, will have their machinery in operation about the 1st of July. The mine is now under the Superintendence of C. W. Boyington, Esq., late engineer of tho Bensley Water Co. of this city. The Company has some 1500 tons of rock out and about 90 men, mostly Mexicans, in their employ.

## COPPER COMPANIES.

There seems to be no abatement, nor present prospect of abatement to the excitement in regard to Copper Mines. Not a day passes without bringing to our notice, either through the interior press, or through private channels, some new discovery or some wonderful deveopment in mines al-
ready opened. It would be useless for us to attempt to ready opened. It would be useless for us to attempt to chronicle all, or even half of the "discoveries" which we see reported; they would be of but little value to our readers. We have given from time to time such practical hints as we have thought would be of value to prospectors, most of which have been pretty generally copied by the interior papers. We have reason to believe that such paragraphs have been read with profit.
The Copper interest has now arrived at a stage of develop. ment which affords unmistakeable evidence that it is soon to occupy a prominent position in the mineral resources of the Pacific coast. Several of the carliest discoveries have al ready arrived at a stage of productive value. Not less than 1200 tons of ore, assaying from 16 to 25 per cent, have been shipped from this port to Boston since the lst of January. The principal part of this amount has been shipped by the Union company of Calaveras county, the balance from the Napoleon and Keystone.
The Union Mining Co., (not incorporated) hold 1950 ft divided into 13 shares of 150 feet, which are now held at a very high figure, with none in the market. The dividends of this mine are expected to reach $\$ 20,000$ per share, for the current year. No assossments have been levied by this
company. The principal shaft at this mine is about 200 feet deep.
The Keystone is the first "extension" of the Union. Tlie cost of opening the mine was $\$ 24,000$, which amount has already been realised. The mine is now in good coudition, yielding about 100 tons of 20 per cent ore per month. It is an incorporated Company with 3000 shares. Its first dividend will soon be declared.
The Napoleon Copprer Co. is located about four miles south of Copperopolis; it is an incorporated Company, with 2700 shares of one foot each. The assessments, thus far, have reached $\$ 13,500$, or $\$ 5$ to the foot. The stock is chiefly held in this city. The mine shows two distiuct veins, and the ore is assorted to a grade of from 14 to 20 per cent. Large shipments of ore have already been made from this mine.
Tarle Mountain Coprer (Oo., Calaveras county, ia now in active process of development. They have tunvelled 135 feet toward the vein, and commenced two shafts, one of which is down 112 feet and the other 45 . Six haads are employed upou the work night and day.
This Alta Copper Company in Del Norte County is an incorporated association. The ore consists chiefly of Carbonates. Active operations are in progress for its development. The Company is already taking out ore of a good quality.
Tae Nevada Copper Mintng Con near Grass Valley. We have already in a rrevious number of the Press, spoken of this Company as having struck very promising ore at a depth of 25 feet. It is incorporated in this city.
Copper Mill Mining Co., is a newly incorporated Company which has recently commenced th developraent of its mine in the Solidad District, Los Angeles county. They have struck the lead in a shaft at the depth of 25 teet, with very excellent prospects.
The Occidental. Copper Co., in the same vicinity, have 20 men at work, driving a tunnel, sinking shafts, ete.
Tuf Solidad G. S. \& Copper Mining Co., also in the ame neighborbood, bave let a contract for sinking a shaft 100 feet deep on their mine. They are now down 45 feet and are taking out ore rich in Gray Sulphurates of Copper. The company has three sets of hands at work night and day-Mr. A. Woodside is Superinteudent of the last nam-
ed mines.

Virginia City, Friday, April 23, 1863.
Considerable excitencut has been munfested in the st nct market during the present wock. The activi!y, howser, has not been calused by any over heated imagination, but upon tetuat developments made in the mines. Betcher has ad rauced from $\$ .50$ to $\$ 150$, with moro buyers than sellers, and a fitir indication of continumg in good request at even bigher rates than the ligures quoted. Thuouly obatacle which is in the way of these clains ranking aroug the first of the territory is the litigation with other compunie. The orv taken tron the mine in quite equal in extent and qualIty with that of the Gould \& Curry it the same doph from the surface. Uuion has been in dem.nd at advanced rates sivee yesterday, having atlained a Bigure one humdred por cent. ubove yesterday's selliug. Demand still unsuppied. New levelopments in a different portion of the miue from that heretofore worked by the company have brought about renewod confidenco in the extent ad well as the undoubted richyess of the mine. Yullow Jack is in request at $\$ 25$ (9) 150 without sellers.
A new discovery of rich rouk made in gradiug a lot on $C$ street han been the sourco of nucla speculutiou un a mall scalo. Hinwever, the bubble of exuitement is alredy boing pierced by more careful redection, and it is pretty generally couceded that if the existence of a ledge in that locibity suould be proven, that those locatiug at tha late day could stand no chance of holding it to the exclustou of the mavy old locations in that locality.
In consequence of the C street striko the Bajazet \& Golden Era has advanced from \$11 (9) 20. The rise will prove temporary, unless kept up by mure substautial developments than these.
Denand is incrousiug for Bullion, Priucuss, and Overman, the two latter haviug advanced it prico one buadred per ecut. during the last week.

## WASHOE STOCE REMARES.

The Stock Brarket durang the week endug with date, has been quite active, and athre anduat of trausters have becu woted. Shacks to the Irolable amount of $\$ 250,000$ bavo chauged hands in Virgluia City aud Gobld IIII. The past will compare litvourably with aly frecedug week, buth iu the aggicgate of busiucse trausmeted athe the gemeral attitulg of stuctis.
The chinf exertement of the period bas boun tho now discovery in Gold Bill, whish consists af a newly developed ledge, of surprisibg richress, imlocality. Should the new ledge prove to be permathe front vein in that locality. Should the new ledge prove to be permanent and continuous, it will doubtlese bo clatmed as a portion of the main Gold Hill possessions, and give rise to a now series of litigations. The immediate result of this important discovery bas beon to produco a decided advance in tho eligibly locilled miter iu its immediate vicinty.
The recout discoveries at Peavine do not yet appear to attract much attention.
During the week something of a rally occurred in the Sacramento, which advanced to $\$ 6750$ @ 70 but declined at the closio to $\$ 6220$ @ 65 , witls llulou
Allalong the line of the Comstock, claims have continued to advauce. Tho late advauce in the Goutd and Curry has created a demund for suvage at $\$ 2000$, and the mines adjuiaing have correspondiagly advanced. l'rom.
incut among then stands the lotosit. locut among thein stauds the Potosi.
The El Dorado is saleable it $\$ 75$, but it is generully held for higber rates, It has grown considerably in favor during the week, and about 200 feet lave been purchused to tll orders from Sau Frabeisco.
Belvidere is marketable at $\$ 2250$, and probably 200 feet have changed hands ut these ligurbs, or a shade lower, since Moaday.
Zouave is quiet aut nithout sules at $\$ 17$ @ 18 No transfers have been
reported.
Norhing is doing in Cole or Santa Ritn. The former is quotable at Si5, und

The P'urseverance, a re-location of tho old Eleloc, is dovelopiug some fiue

## WHEELER'S

Amalgamating and Separating Pans,
It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturationg and amalgamating purposes to any otber in use.
The mnst important privecinle connected with the ope-
ation of these Pans is the sen ration of these Pans is the separation of the triturating process from thit $t$ of extracting tho amalgam from the
sand. Thue ebief cause of luse of the precious metals arisand. The ebief cause of luss on che precious metals arithe quicksilver, during the proces of trituration, aud in
cleaning up. By the iotroduction of ILe Seraratiog Pan cleaning up. By the introduction of LLe Seraratiog Pan
to $f$ Ilow the trituration this loss is eutirely arnided. In
to working these machives uhere is no appreciable loss of
quicksilver, and hence nove of the precious metals. quicksiver, and heace nube of the precious metals.
Wbere these Paus hare been introluced and operated
by the side for others ou sands from the same vat, the
Whe by the sidu nothers ou satus from the same vat, the
Wheeler Paus have uufrormly goined a large purcentage
of inetals over its competitors, as well as a still larger of intals over its competitors, as well as a
porcentage in the amount of work performed.
*** These Pans man be seen in daily operation, at the
Miser's Foundry, on First street in this city, where Mixer's Foundry, on First street in this city, where alf interested are isvited to call and examine for themselves.

## OUR MECEANICAL INDUSTRY.

We have already alluded to the wonderful progress which an Francisco has made durng the pust four ar five years mechanics and manufactures, and have proposed to give ir readers a brief notice of some of these industrial estabhments which are working out such vast accessions to the osperity and permanence of ourcity and state. In connuing these notices from week to week, we do not propose confine onrselves altogether to the large or "first class" tablishments; for we are not unmindful of the fact that 1 sach have grown np, within a few years, frum small be naings, to their present colosal proportions, and that otha that are now circumscribed in their operations, and kept ck, for the time being, perhaps by the lack of capital or fluential friends, have nevertheless all the ingenuity, skill d energy, re quisite to manage the most extensive works this description. All such are destined to advance with a growth of the city, and many an owner of a small es-dbl-shment, or one who is now simply a working mechanic, filing long hours in dark and contracted shops, will ere ag find themselves owners in large and flourishing estabhments, with scores and perhaps hundreds of men in their nployment.
The field of operations for mechavicsin this city is ununded. The demand for machinery for mining, milling, anufacturing, etc., is increasing with rapid ratio, and where ores are now employed, hundreds and perhaps thousands, Itl in a few years be required. Our mountains, north and buth, from the very coast to the far interior, through and her the Sierras and streatching across the "Great Basin" fite to the Western Slope of the Rocky Mountains, are Il of minerals of every known description. So numerous o our mines, that explorations, instead of decreasing the hances for bew operations, actually adds ten, twenty and hundred fold to the chances. Never before in the history Califoruia, or indeed of the world, has there been such excitement about new mineral discoveries as at the presAt time, and never before was the faith of our people so mly fixed in the absolutely inexhaustable nature of our ines.
Centaries have heen insufficient to develop, to their present ktent, the mines of the insignificant territories (insignifiant ic extent) of Cornwall and Wales. What approximaon then car we, on the Pacific Slope, hope to make in a ingle century, toward the development of a territury ten pld richer than Cornwall ever was, and ten times larger pextent than the entire British Isles? When the nur-ing hild of to-day shall walk our atreets a tottering old man of pur score and ten, he will behold in this city a population arger than is now collected on the entire Pacific Coast, but - will not see one particle of abatement in the mining exitements of the day, or notice any diminution in the numer of "new discoveries" reported in the morning papers. these are sober thoughts-the legitimate inferences of presnt indications, which cannot be ignored, and of which we bould not be unmindful.
San Francisco is to become the London of the Western orld-the greal emporium of Asiatic commerce in its transit
eastward, and the centre and radiating point from which are to proceed all the supplies of machinery and material of every description for the development of our mines and to feed and clothe the people of the interior. The re-opening of the deserted mines of Mexico, and the late wonderful developments on the Fastern Slope, as we have before remarked have already occasioned a largely increased demand for machinery over provious years; but the imagination can scarcely picture the enormous increase in such demand which present indicaticns foreshadow. Nearly all this supp'y of machinery must be furnished in San Francisco. Scarcely a single decade has elapsed since the first steam engine found its way into the interior of the Pacific Slope. Now they may be numbered by thousands. A few years ago they were obtained chielly from the East. Now $\left\lvert\, \frac{1851}{2852}\right.$ the supply is obtained almost exclusively from the workshops 1853 of this city. Where hundreds of these tireless machines are now employed, thousands will soon be required. Indeed the time is rapidly approaching when the only limit to their employment will be the supply of fuel for their consumption.
The wonderful developments of the past few months are giving the mechanics o San Francisco, but a mere inkling of the great magnitude which this interest is sonn to assume. This city must continue the workshop of the Pacific Coast. No other point possesses adrantages which can, by any possibility, attain to any formidable rivalship.

## COPPER STOCES AT THE EAST.

Considerable excitement is manifesting itself in Boston, about this time, in relation to copper mining. The present high price of copper, and the remarkable success that has recently attended the working ot the mines, both at Lake Superior and in Canada, is attracting the attention of both investors and speculators, and it is believed that the returns of the next two or three years will be very important. Near Iy all the Lake Superior Mining Stock is advancing.
The-Acton Mine, Canada, is still making most, satisfactory returns and its stock is in demand at advanced rates, with but little in the market. This mine within the past few months has proved itself to be very rich, and the vein improves, the deeper it is worked.

The subjoined quotations were recently given in the Eastern papers, as an evidence of the "great advance in Prices" in Copper Stocks. A similar advance in the San Francisco market, would scarcely be noticed, bat in Boston, it is noted as something very remarkable:-
Acton......

Bohemian
Canada
Central. Copper Falls Franklin. Hancock.
Huron. .
Huron..... Isle Roya
Toltec ...

Monday, Monday, Monday, Monday,
Feb. 23. March 9.
Feb. 23. March 9

The Lake Superior News and Journal of Jan. 16, 1863, gives the following tables from the most reliable data attainable, showing the rise and progress of the copper business of the Lake Superior region, from 1845 to 1862. The amounts given refer to the rough copper produced as weighed and valued for shipment:-

| Shipm's in Tons. |  | Value. | Ship | Tons. | ¡Value. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1845 | $3 / 4$ | \$ 390 | 1854 | 2300 | 805,000 |
| 1846 | 29 | 2,610 | 1855 | 31.96 | 1,437,000 |
| 1847 | 239 | 107,550 | 1856 | 5726 | 2,400,100 |
| 1848 | 516 | 206,400 | 1857 | 5759 | 2,015,650 |
| 1849 | 753 | 301,200 | 1858 | 5896 | 1,610,000 |
| 1850 | 640 | 266,000 | 1859 | 6041 | 1,932,000 |
| 1851 | 872 | 348,800 | 1860 | 8614 | 2,520,000 |
| 2852 | 887 | 300,450 | 1861 | 10337 | 3,180,000 |
| 1853 | 1452 | 508,200 | 1862 | 9020 |  |

The authority before us does not give the estimated value of the yield for 1862, but makes the foliowing allusion to it, in substance as follows:-Although the yield of the mines for 1862 is less in tons of ore than the yield of the previous year, still the amount realized from the sales of copper will be largely in excess of the amount realized in 1861, the price of copper being higher the past year. So that the mines have actually paid better than in any previous year.
The Lake Superior mining region is divided into three Districts, the Portage Lake District; the Ontonogon District ; and the Keweenaw District. The first named contains seven producing mines, the second twelve and the third ten-making in all twenty-nine producing mines. The average product of these mines for the past year has been $\$ 163$,275 -estimating the value of the copper produced at $\$ 700$ per ton. "There is no question," says the Philadelphia Mining Journal, "but that the peninsula of Michigan is a California in mineral value. Moreover, it is near by; for, wher the Philadelphia and Firie Railroad shall have beyn opened to Erie City, it will not be long before the copper region of Lake Superior will become better known in this city ; because, then, in a car hence to Erie City and a boat thence to the farthest of the great lakes, a visit to Copper Land will combine business with adventure, in a new direation.
With a descending navigation from Lake Superior to Erie City and a single rail interest thence to Philadelphia, there will be cheap and convenient commurication with the mineral territory of the peninsula of Michigan."

Cast Iron has been recently experimentally manufactured at the Crevelea Iron Works, in Ireland, by the use of condensed peat. The quality of the iron thus produced is said to be equal to the best Swedish iron.

Telegrape to Reese River.-Telegraphic communieation has been establishec to Austin, in the Reese River country. The first message was sent from there on the 25 th ult.

Rice.-Rock from the Monitor District, Nevada Territory, assayed at Virgiuia City, has turned out over $\$ 8,000$ to the ton.

THE MINERS' I.ABORATORY-NO. I.
We have already announced the preparation of a series of articles under the above head, in which we propose togive a brief digest of so much of the interesting Science of Mineralogy, as sball be of practical utility to the miner and prospector, in his labors and explorations in the field. These papers will be prepared from the latest and best authorities and will embrace the entire range of mineral and metalliferous deposits. We shall not waste the time. of the reader to any extent, by any geaeral remarks not strictly belonging to the subject under consideration, but endearor, to the utmost of our ability, to render these papers a practical manual that shall be especialy useful to the prospector and miner, and at the same time, not entirely devoid of interest and instruction to the general reader.
In order to treat the subject intelligently, however, so that it may be correctly understond by those who have hitherto paid but little or no attention to mineralogy, it will be necessary to give a brief introduction, explanatury of certain terms and conditions, which must be used and referred to. Without such explanations these papers will be of but little comparative value either to the general reader, or to the miner who may now, for the first time, desire to gain an ensight into the science of pactical mineralogy.
introductory.

The primary object of this scieace is the development of miveral bodies; a knowledge of their characters, forms and combinations; also the circumstances and conditions in which they are found, and the substances with which they are combined. This is the practicat object of mineralogy and the point upon which we propose to treat priacipally in these papers.
A development of the nature of minerals, a knowledge of their elements, their properties and uses, constitutes the eoonomical portion of the science, which though highly inter esting and useful to mankind, is not a matter which we propose to discuss to any extent. The miner is directly interested only in the development-the bringing to the surfaceof the minerals of the earth ; their economy and general introduction into the various channels of business, he leaves to those into whose hands he delivers them in their rough state.

We know but comparatively little of the earth beyond the depth which has been reached by mining operations. This depth when compared to the entire bnik of the carth, may be correctly compared to the minute seratching and pia punctures of a coat of varnish on a 12 -inch globe. All beneath is mystery and speculation. Of this we shall treat more at length in fature numbers.
A Mineral is an unorganized body, differing from an organized or living body in its structure, in the manner of its formatian and of its increase or growth. While organized bodies increase by means of their internal organs, which assimilate and retain in the system what is beneficial and reject what is useless, unorganized bodies increase externaly.
A simple mineral substance, as pure gold, silver, etc., may be described as an organized body, presenting an aggregation of lesser particles of the same nature, united by affinity. Every mineral possesses two distinct kinds of charaeter, by one or both of which it may be distinguished from other sabstances. These are termed the external and the chemical characters. 'The former are commonly apparent to the senses, and the latter are those which are developed during the chemical decomposition, which may be accomplished with or without heat. These characters are denominated as follows :-Aspect, or kind of lustre; color; havdness; specific gravity; streak; form; structure; cleavage; surface; tenacity and transparency.
Aspect, or Kino of Lustre, is very important, and is divided into metallic and nou-metallic aspect; they are often blended in the same mineral. Many minerals also possess two distinct kinds of lustre, one externally aud the other internally. The true metallic lustre may always be distinguished from the metallic, pearly-adamantine lustre, by its being always combined with perfect opacity, and by remaining unaltered on the scratched surface.

CoLor is also of considerable importance when combined with metalic aspect. In speaking of color, in connection with minerals, the depth or shade of color should be carefully noted, and the peculiarity of shade expressed as near as possible, by reference to some well known substance.-

The metalic oolors are white, divided into silver and tinwhite; grey, lead-grey and stel-grey; yellow, brass-yellow, bronze-yellow and gold-yellow; black and copper-red.
HARDNESS is one of the most important of mineral characters. There are generally reconed ten degrees of hardness : 1, yields easily to the nail. 2, yields with difficulty to the nail. 3 , seratehes a copper coin, but is also scratched by it. 4, not scratched by copper but, is not hard enough
to seratch ylass, 5 , seratches glass, though with difficulty, to scratch ylass. 5 , scratches glass, though with difficulty,
leaving its powder on it and yields easily to the knife. 6, scratches glass and yields with difficulty to the knife. 7, does not yield to the knife but does to the edge of a file, though with difficuity. 8 and 9 , harder thar flint. 10 cuts glass.
Specific Gratitx - That is, the weight of a body com: pared to some other body of the same size or volume. This latter body is assumed as a standard; this slandard is pure water at a temperature of $60^{\circ}$ Fah. A cubic foot of water weighs $997 \cdot 136$ ounces-usaally taken as 1,000 . A cubic foot of silver weighs 10,000 ounces; therefore we say silver is ten times heavier than water, and its specific gravity is $10 \cdot 0$.
Strear is a very effective character; it signilies the color of powder, produced by drawing or strealing a mineral across a file. The best way to distinguish the streak is to take a fine file, and drawing it once or twice across the mineral, pass it lightly over your finger; when the color will be left thereon, and may be easily noted.
Form is a character, when regular, of the higbest interest, yet of limited utility in the discrimination of minerals.
Stiucture and Cleavage.-The structure of minerals is the mode of aggregation of the particles of which they are composed. Lamellar structure is composed of broad, dis tlact concretions, of about equal length and breadth. "Prismatic, or biaded structure, consists of long and narrow concretions, forming a transition from the lamellar into the fibrous structure. Fibrous structure, consists of fibrous, or very thin and capillary concretions, either straight or curved. Granular structure is composed of minute or small concretions, having a nearly equal length, breadth, and thickness. Compact structure is devoid of any distinct concretions, and appears to consist of one compact mass.
Surfact.- The surface of minerals may be either uneven, granulated, rough, smooth, or streaked : streaked surfaces often arise from a close fibrous structure, or otherwise indicate the direction of cleavage planes.
Tenaciry.-The following are the different degrees of tenacity :-Brille, such as grate under the knife, or fly off in the form of powder when attempted to be cat; and break into powder, when placed on an anvil and struck by the hammer. Sectile, possessed by minerals which yield in a great degree to the knife without noise, the particles remaining on its blade : sectile minerals crush into powder under the hammer, Maleable or ductile, the property posseased by minerals which may be cut by the knife, and which flatten into spangles under the hammer.
Transparenoy.--The following are the degrees of transparency, or transmission of light, as possessed by minerals. 0. Opaque 1. Translucent on the edges. 2. Translucent. 3. Semi-transparent. 4. Transparent.

Dearee of Lustre is distinct from the kind of lustre or aspect of minerals. The degrees of lustre are marked by the following numerals. 0. Dull, devoid of lastre. I. Glimmering. 2. Glistening, or weakly shining. 3. Shining, as rock crystal. 4. Splendent, or strongly shining, as galeпа.

Fracture is a character of minor importance; it is the appearance of the suafaces produced on breaking a mineral in any direction, except in that of its natural joints or clearage planes, which ought to be always smooth, and more or less shining.
Form, Frangiblity, Flextblity, Touch, Solling and Sound, are all terms which are sometimes employed to describe the characteristics of minerals, but ns they are of little importance to the general student we pass them by.
Odour is confined to a very few minerals; some emit naturally a degree of odour, in others it is produced oy breathing on them ; in some by friction, and in others it is developed by heat.
Adeesion to the tovere is a character possessad by such minerals as freely imbibe moisture, and is common to almost all earthy mechanical mixtures and decomposed specinens,
$T_{A S T E}$ is a characteristic properly possessed by such minerale as are soluble in water.
Madertisn is a characterstic of limited application, bat in many cases a very important one. The only metals which attract the magnet, are iron; nickel, and cobalt ; and there are very fer that affect it in their natural state, but many do so alter their exposure to the action of the blow pipe.
Electricitry.-To ascertain whether a mineral possesses this character or not, a small instrument called an electrometer is necessary. Electricity is produced in minerals, either by heat or fiiction. To try if a mineral possesses the property of elecricity, first rub it briskly for a few minutes with a woolen cloth, and then present it to one of the pith balls of the electrometer; or, heat it gently through and do the same.; if in either case it attracts the ball, then it popsesses electricity.
Phosphorescence is a property possessed by some few minerals, of emitting by heat or friction, a faint light. Minerals which become phosphorescent by heat, will almost invariably be found to contain either fluorine, chlorine, plos phoric acid, boracic acid, or the salts of baryta, lime, or zinc. This is however, a very uucertain character, as there are varieties of the same substance in which it can and caur. not be developed.
The chemieal characters of minerals, are the effects proc duced on them by the action of acids and of the blow-pipe of which we shali treat in a separate arlicle wherein we pro pose to give general directions for the use of the blow-pipe
The effects produced on minerals by the action of acids re very inportant. These effects are effervesseence, solu bility, partial solubility producing a gelatinous raass, \&e. 'Th, develop these effects, the mineral sbould be reduced to pow der, and placed in a small test-tube or other vessel, and the acid, either pure or diluted, must be geatly poured over it The application of heat is sometimas necessary, in whicl case a spirit-lamp is made use of, and the mineral and acir supported over it in a test-tube, watch-glass, or small cap. sule of Berlin porcelain, or of platinum, by means of a thit bent wire.
The treatment of minerals by acids will be fully explain ed id its appropriate place.
Morsture in tere Atr.-The atmosphere always containa water. Most people think its presence a misfortune. The! say the atmosphere of California is very healthy because is so diy. This is an error. The air of California has great deal more moisture than that of New England, that is the principal reason for its superior healthfulness in New England the dry air sucks the moisture nut of man's air passages and he has the consumption. If he coulc breathe the moist atmosphere of the Pacific coast, he migh recover. In their influence on consumptives I do not mea to say that the only difference between the Atlantic ani the Pacific coasts, is found in the amount of atmospheri moisture. But I do say that this is one of the most essen tial sanitary differences. A man who, in New England, i ever suffering with dry and cracked skin, has in Californis moist and healthy skin. What is true of the skin is tru of the lining of the lungs, with which the same air is in cor stant contact-the dry air sucks out the moisture and duces disease. All other things being equal the moister air the healthier it is. Of course this law censps to hol whenever the moisture becomes seasible, and the clothing. thereby saturated. [Journal of a Traveler.

An Extensive Mining Cladr.-The Placerville Demu crat speaks of a Mining Company recently formed nes Diamond Springs, which consists of 150 members, wi claim 300 feet each, or about 9 miles of ledge for the entil) company! The company is styled the "Black Quartz Gol. Silver and Copper Co.." and the ledge is pronounced U good judges one of a most promising character.

The Ponger Mill for Reese River is now on its wi, thither, from Pike's Peak. It is an eleven stamp mill, ax will be located near Clifton. Machinery, overland, from t East to the Pacific Slope mines is a new idea.
Messrs Buel \& Dorsey of Clifton, are now on their wi thither, or are already in this city, for the purpose of buyin machinery to take to Reese River. We may soon. expe some practical results from this newly discovered minuing gion,

## MINING AND SCIENTIFIC PRESS.

Mining Iscident. - A few mouths since a gentleman, who ow kepps a restaurant in this city, but who at the time of e Incident narrated below was keeping a similar establishent in sacramento, was accosted in the street, by mather a Hly looking individual, who frankly informed our restau ft kepper that hewas fuet broke, and hungry. Like a od Samaritan, as he is, the dispenser of edibles invited e stranger to make himself at home at his table until ch time as he could get work. He remained with his henactor several weeke and then left for the mines. Some onths afterward the restaurant keeper received from b hands of a stranger, a third party, some certificates of pek in a quartz mine, in payment for his kindness to stran No. 1. The stock was then of but little value, and 3 laid aside for the time. Sometime afterward, having anged his business to this city, and noticing the growing erest in mining here, the restaurant keeper bethought nself of his Sacramento investment, made enquiry as to value, and to his no small astonishment, suddenly found aself in possession of mining property worth $\$ 15,000$. had cast his bread upon the waters and it had returned thim many thousand fold.

## TO MLNERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable heral deposits, other than gold, in almost every section of e State, which have of late been made, it is but reasonato sappose that prospecting even in California, has but If commenced. The simplest and most universal of all taliferous deposits is gold. It rarely occurs in any other Sm than that of "free gold" which is readily discernable to 1 naked eye. An examination of any rock or earth for d is an extremely simple process. If its presence is susfeted in alluvium, the simple washing of that alluvium in a In is an invariable test. If in rock of any description; I rock pounded fine in a mortar and washed, in the same funer as alluvium, will usually expose its gold to the nad eye, if there 18 any there in paying quantity. The only ceptions, are where the gold is contained in iron pyrites, copper pyrites containing also iron. In either of the to latter cases the presence of gold may be readily ascerfoed by placing the pyrites in any suitable vessel and pping the contents at a moderate heat for from four to six hars, with frequent stirrings, by which means the sulphur I be evaporated, and the copper, if any is present, changto a dull red color, and the gold retaining its natural apprance, on subjecting the whole to the usual panning peess, may be readily seen by the naked eye,
Not so with other metals. Silver, copper, zinc, nickel, d many others appear in such a great variety of metallif\&us forms as generally to defy all but the most practical A scientific eye. No description of these ores can be tten which will afford any very important aid to the in-中erienced in making explorations. Alter reading deiptions, however, and carefully examining the specimens derribed, the explorer may go out and search with some depe of confidence and intelligence. A study of the charperistics of the sulphuret ores alone, would lead an exprer to pass over, entirely unnoticed, the nchest varieties the ores known as Chlorides or Hurn Silver, which, from facility with which they nuay be worked, and their usual funess, are generally considered the most valuable of silver 88. There is much reason to believe that this variety of ver ore will be extensively found in all the volcanic repns of this State. So with many other ores. Considering the great difficulty, in the present lack of binet collections, and other means of instruction, to acire a practical minerallogical and geological education in is State, and desirous to aid, to our fullest capacity, the velopment of our mineral resources, we hereby make e offer to miners, prospectors and all others, who in their avels or explorations may come acruss specimens having e appearance of rarity or value, to carefully examine and onounce upon the same, free of charge, as to their charteristics, value, etc., wheuever any such specimen's are ought or sent to this office free of cost to us. We have ready been called upon in many such cases, and we shall all times be willing to give our attention to any sach rehests which may be presented to us.
Our object is to furnish the miners of Califoraia with evy class of information which shall be valuable, to them in
the progress of their calling and in the developent of the mineral resources of the state, and we know of no way in which we can devote a portion of our time roore to the interests of miners than in the manner here proposed. The only equivalent wo ask is that they shall do what they reasonably can to sustain and improve the paper devoted exlusivoly to their interesta.
In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. Tne ordiunry rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any runusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzoze nature, which presents any utcommon appearanco in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the canse of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come ander the notice of the California prospector; and we have the promise also, at an early day-probably within a week or two-of a series of articles under the head of "The Mr NER's Laboratory," which will be prepared especially for this paper by one of the most skillful metallurgists on this coast, and which will be found of great value to the mining public.

## SAN FRANCISCO MINING NOTICES.

Assessments upon Mining Stocks have been levied as fol-
Garabaldi.-Assessment of $\$ 1$ per share, levied March 2nd.
Sutro:-Assessment of $\$ 1$ per share, levied Feb. 23, payable March 23.
Silver Quartz Mill Co-Assessment of 5 per cent. levied Feb. 23, payable March 28.
Napoleon (copper.)-Assessments of $\$ 3$ per share levied Mar. 3, payable in 30 days.
Golden Age.-Assessment of one dollar per share levied Feb. 24, payable March 26.
Washoe Gold \& Silver.-An assessment of 2 per cent. in capital stock was levied Feb. 16, payable Apr. 1.

Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

Subsoribe,-Are you a miner and not a subscriber to the Mining and Screntific Press? If so, you are an annual loser of many times the price of e year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookistore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?", If so, and you desire to send important information and valuable reading matter, jou can find no paprr that will be read with so much eagerness by them, or one that will convey to them so fall an account of the real industry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars, or two dollar's for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we' are anxious to introduce the paper where it is not now known, we will, for the preseat, send the Press for three months even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one
will wish to discontue the paper after being ai constant reador of it for even that short period.

mining and scientific press.
THE ONLY MINING, MECHANICL AND SCIENTIPIC Paper on this continent.

## THIRD TEAR: VOIUME NT.-NEW SLRJESI

A now volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall ho repleto with information
concerning Mining, sicientific, Mechanical and Industrial pursuits, together with soveral original eugraviugb, of new inventions, etc., prepared exprossly for its columns.
This paper is devoted to the above purnoses, tngether with the intorests that may be of interest to the reader : and it is the intention of ino proprie tor to sjare no pains or expense in making it equal in iuterest and valuable aformation to any paper yet publisbed.

## The Mining Interest!

Will and it of great value, as it will contain all the news anpertaining to Mining the prices and sales of Mining Stocks, Dow inventinns of Machinery adap+ed to that purpose, and of everything generally that may be of service to the Miner.

## The Inventor I

Will 6nd it an excellent medrum for the purpose of bringing his infention into notice, of nsecrtaining the progress of invention in this and other in oltaining his patent, the preprictor having had great experience as a pateut Agent, together wib facilitios at Washington that enable bim to ob ain Patents with dispatch.

## The Mechanic and Manufacturer !

Will be greatly benefited by its porusal, as each number will contann seva eral oripioal engravings of new machines and inventions, together withy
large amount of reading matter appertaining thereto. Wo are constantle receiving tho best scientific journals from all quarters, from which wr shall continue to extract whatever may be of bencfit or intereat to oureaders.

To Chemists, Architects, Millwrights and Farmers ! This jourual will be juvaluable. All new discoveries in Chemistry will be
given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will pot be neglected, engravings will be given of agricultural implements, and tho farming interest genorally will be amply diacussed.

## Terms.

To mall subscribers:-Four Dollars per annum. Club Rates.
Five Copies for Six Months, $\$ 8$.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, $\$ 30$.
Ten Copies for Twelve lionths, \$30.
Trenty Copics for Twelvo Months, $\$ 56$.
For all clubs of Twenty and over, the yearly suhscribtina is only $\$ 280$ Names cau be sent in at clifferent times and from different Post-olfices
Specimen copies will be sent gratis to any part of the country.

EWER \& SMXHE, Publishers,
Room 27, (formerly) U. S. Court Building, Corner of Washingten and Ba
tery streota, Sau Francisco.

## Our Mint, its Rules, Charges and Oporations.

For parting silver from gold when gold
is below $300-1000$ ths. fine.
"
3ets per oz.
from 30-100ths. $10750-1000$ ths fine. $7 \mathrm{cts}^{\circ 1}$ " oz. $750-1000$ ths to $950-100$ ths " 14 ets " " Depostyg Silver Bullion-Purchabes.
$\$ 1.21$ per standard ounce $1 / 2$ per ct. on gross value of all gold contained for coinage.
Refining charges (only where gold is contained) proportion of gold 1 to 300 3cts. per oz. gross weight 301 " 500 , 7cts,

## Defosits for Fine Bars

$\$ 1$ 16-4-11ths cents. per standard ounce, $1 / 2$ per ct. gross value of silver for making bars; also when gold is contained $1 / 6$ per ct. on gross value of gold for coining. Refining charges as in purchases.

Bars Sold From Refinery.
$\$ 121$ cts. per standard oz. $1 / 2$ per ct. gross value to be ad ped for making bars.
\$1 16-4-11ths. per standard oz. $1 / 2$ per ct. groas value for coining, when gold is contained, refining charge the same as in purchases.

Deposited for Imported Bars.
\$116-4-11ths. cents per stadard oz. 1/2 per ct. gross value of deposit for making bars.

## PROGRESS OF THE MINING INTEREST.

We still continue our notes of Mining Progress. There appears to be no diminution of interest in miniog operations, but rather al increase, and a more general desire than ever to invest. New discoveries and new developments in old workings are constantly being made. In the excitement consequent upon such a state of things it is gratifying to notice a growing dieposition, among out side operators, to observe more caution in their investments. One of the first things to be required by that class of buyers is that the stock which they purchase should be controlled by a regularly incorporated company, whose officers and chief managers should be well known as men of integrity. Care also should be taken to learn the actual condition of the mine, the extent to which it has been developed, the character of its tille, whether disputed or perfect, etc. There is no need to be rash or in haste to invest. Opportunities for good investment will increase monthly, and yearly for many a generation to come. Quartz mining is very different from placer mining; for while the latter may soon be skimmed over, and the richest workings exhausted, the former will be likely to improve for decades if not for centuries. The cream of the quartz mining business in California and the adjacent territories is yet far in the fature.
virginia district.
The Cole is running a new tunnel to strike the lode at a depth of 575 feet. They are already in 150 feet. This company, we believe, has the deepest shaft in the Territory. Their main shaft reached a depth of 365 feet some two or three months ago, since which time we presume the work has still been continued uponit. Some very exc. llent sil ver bearing rock was taken from this shaft at a depth of 340 feet. The next deepest shaft in the Territory is on the Hale \& Norcross ground, and is only some 40 or 50 feet less than the Cole

The Dane is taking out ore from a 20 foot shaft.
The Dunn has recently struck very good rock, which, at last accounts was improving as the work progressed.

- The Scorpion have driven their tunnel to a distance of 625 feet, and are expecting to reach their lode inside of 100 more. The depth at which they will strike it will afford a good test of its value.
The Charles Caney have a good vein in their engine shaft at a depth of 56 feet. They have a 25 -horse power engine now on the ground and in precess of erection.

## gOLD HILL.

Very interesting and important developments have been for some time in progress in and about Gold Hill, and a large share of attention is being torned in that direction; every day, almost, brings something nesy from that locality.
The Belcher, (which was noticed in our Washoe correspondence of last week.) in consequence of new developments, has advanced within the two weeks past from $\$ 50$ to $\$ 450$ per foot. The mine, at last accounts, wore a most promising aspect for even larger advances.
The Kellogg, Bail \& Co's clain of 85 feet and "Bob. Apples" interest of 75 fret, the two next adjoining the Belcher will lose none of their value by reason of this "strike." The latter, indeed, is already improving in appearance, at the mine.
The Oferman Co., the third from the Belcher, compriaing 1200 feet, has united with the Apple Co. in sinking a joint shaft on their dividing line, which, it is mntended shall be equal in workmas ship to anything of the kiod in the territory. It will be 12 by 5 . feet in the c'ear, lined with 3 -in plank, and constructed in three compartments-two for cars, and the other for the pump ; this shaft has reached a depth of 100 feet, and is intended to connect with the Over man tunnel, which is in 750 feet, and will not be completed much before the shaft is ready for it; the tunnel will drain the ledge 234 feet below the surface. Mr. Apple was offered $\$ 600$ a foot last week, and the Overman was held at $\$ 80$.

The La Motte made a rich strike in their lower tunnel, on the 23 d ult, in consequence of which their stock suddenly advanced from $\$ 15$ to $\$ 70$ per foot. This Company's tannel was only recently commenced, and rans in on the length of the ledge, from Bower's ravine, at Gold Hill; it is said
the lead is thirty feet wide and the pay streak recently struck about twelve inches wide. There are 1200 feet in the claim The Company was incorporated on the 14th of March last.
The Golden Gate.-I'he shaft of the Golden Gate Company, on the divide between Virginia and God Hill, bas reached a depth of 140 feet, and namerous small spurs, or feeders to the ledge have been cut through, which much resemble the Gould \& Curry. What was supposed to be the main lead was passed through some time ago; it was about twenty feet wide, but contained no mineral of any consequence. The shalt will be continued to a depth of 300 feet, and a drift run to the ledge, when the share hulders will be able to arrive at a fair approximation to the value of their mine.

## devil's gate district.

The Alamo are taking out rock, averaging about $\$ 50$, from a 60 -foot shaft. Their rock is crushed by contract.
South Hadley.-This Company has struck the lode at a depth of 60 feet.

## FLOWERY DISTRICT.

The Rogers, one of the oldest locations in this district, have run their tunnel 560 feet, and are now putting down an additinnal shaft. This company has a steam mill in operation, with 10 stamps, running upon custom work.

## esmeralda.

The work of development is still progressing finely in this region. Tunuels are being run and projected in every direction, where surface indications point to rich minerals below. Tunnel Enterprises, indeed, seem to be a feature in Esmeralda and evince the confidence which holders have in the "feet" that they have located.
We have heretofore, through our Esujeralda correspondence, given a pretty full account of most of these undertakings. A new enterprise of this description has recently been undertaken which is quite fully described in the Star of the 25 th ult, from which we condense:

The Stanford Tunnel just being commenced is one of the best mining enterprises ever started in this District. It is located on the western side of Silver Hill and about a quarter of a mile above the American. The Company are composed of staunch business men in Sacramento and San Francisco as well as old experienced quartz miners here.
The President of the Company is Governor Stanford, Secretary, Newton Booth, of Sacramento, where the trans fer office is kept.
The Tunnel when completed will be three thousand feet in length and will embrace all the blind ledges for two hundred feet on each side of it. A handsome cut bas been opened from eight to twelve feet wide and fifty in length; the present contract is being completed under the Superintendency of Mr. A. E. Libby.

The company have a good location for a large mill, the erection of which will soon be commenced. The Tunnel will strike the Utah and all those rich ledges which cluster and run together on that side of the hill, reaching them at a depth of eight handred feet, together with all the rich blind lenges which they are bound to strike. They are already taking out rich boulders which will pay for crushing, and as fast as they take them out they break them to pieces and pile them up. Success to the Stauford Tunnel.

New Roce Drilling Machine.-Think of using diamonds to cut rocks with! But an instrument for boring into hard rock, made out of a tabe furnished with a circular cutter of rongh diamond, is now being employed in France It is caused to revolve, and, as it enters the stone, the cutter scoops out a cyinder, which is afterward easily token out of the tube. Holes in hard granite, for blasting purposes, two inches in diameter and four feet deep, are thereby bored in one hour. This would require two day's work in the ordinary way. The diamonds, when examined through a magnifying glass, do not look at all injured.

Mount Shasta O'ertopped.-Mount Shasta has hitherto been considered the highest peak in the United States. A recent measurment of Long's Peak, in Colorado, however, proves that mountain to be 14,470 feet above the level of the sea, or tharty feet higher than Mount Shasta.

A watce factory is in successful operation at Petaluma.

Mineralogical.-We would call the especial attention of such of our readers as are not acquainted with Mineralogy, but who desire to obtain so much knowledge of that interesring science as may be requisite to enable them to pursue, with a fair degree of confidence, the ordinary service of prospecting for minerals, to the series of articles which we have cormenced in another column, under the head of the "Miners' Laboratory." These articles will be found very valuable to all miners, and will afford sufficient instruction in the general principles of mineralogy, including the use of the blow-pipe, and qualitative assaying, to enable any person to arrive at an approxinately correct conclusion with
regard to the general characteristics of sach minerals. The number which we give this week may seem devoid of interest. or special value, but its careful study is indispensible to any proficiency in this department of knowledge.
We have been induced to prepare and publish this series of articles in consequence of the absolute lack of any books of instruction on this coast from which the information we prepare may he obtained. Miners will do well 10 either file the papers containing them, or cut out the articles and file them away as scraps. The series will bo regularly numbered.

## GENERAL MIINING STOCK REPORT.

At the San Francisco Mining Stock Board,<br>For the week ending May $2,1863$.

## REMARES

Quite a large amount of business bas been done in the miniog share market during the past week, and genorally at improved rates. The advances have mostly been based upon actual developments and improvements at the mines. Several instances of important fuctuations have beon noticed, produced mostly through speculative operations.
Ophir and Gould \& Curry bave both been inactive during the weels. The ormer has remuined quite firm at about last weeks quotations, while the latter has adranced about $\$ 00$, remaining 6 rm at $\$ 3600$. We neglected in our last to notice the payment of auother monthly dividend of \$100 to the foot by the Gould \& Curry.
The chief transactions of the weck in Virginia Stocks have been confined to the Chollar, Daney, Burning Moscow and North Potosi.
The Chollar has been steadily advancing for the lart two weeks. During that time it bita gone up from the depressed figure of $\$ 56010 \$ 505$.
The Daney still continues active, but at lower rates than the week pro-

Irun from the mall have not boen quite so fuyorable as those of provious Burniog Moscow has been eonslderably dealt in at improvat rates. Wo rote as bigh as $\$ 17 \%$ : Cish and F2lC o 30 .
North potost has boun moro active than usual, though at slighty doproch. ed rates.
Poloal th firm at couslderable advance, with myo buyera than sollors. Mount Hope, aypialag the Putost in begianing to attract consulerabie at-
 Charles Cancy has decitnod slifthty and is lens nctivo. Tho Company has grod vein at a depth of oo feet, and steam power about goling tato opersEa Darado ha a been more actire than asual during the week nt largely adhooms rutea, cauned by

## huydourt hid reas aiver.

Zurnboldt and Rimese River Strctss are loginuing to attract attention in this hurket. Sheba is held firm at about $\$ 500$, with but little in the market. D
 lef knowa in this market are the Sheba, No Soto, Schuylsill, Bea Frank
n, Goldeu Ago Serlea, Hoonlight, Hagon Charha Serlen, Peerless, Roso n, Goldeu Ago Surlea, Joonlight, Jingon Charua serten, Peoriess, Roso
hitman abu Fort Pitt. There ure donbeless others, porhaps more valua hitman which have not yot generally becumo much knowa bere.
From Reexe River we have most favorable reports, and important results ro conddently leoked for, an seou as the mills under contract and to cous emplation abali be put in motion. The Govornor Soymour, Unlon, Hurfor and Honost 3fieer havn each n a quantity of ore now on its way to thle ity to he tested here by machinery, in working quautities. Assays from hesc ctaims are high; but the only satinfactory results are those obtained rom regular working machinery. Wo shall a wait thoso reautu

## sergraida

The Wide Weat has not yet recovered from the depression causor by the to uarxpected agxessment, although it is said the Company's milt is work g with moat satisfuctory results. Three hundred pounds of unretorted waigam are reported as the result of one wcek's run of ten atamps. Antelope is improving, also the Real del Monte.
Silver tull continues active at matorially fmproved rates. We quote toay as high as $\$ 75$ cash, 14 advance on the bighest rates of last week Josephine and Willow Springs in the Coso district still remain active at proviour quntations.

## TEE COPPER INTBREST

Is still improviag in favor and enhaocing in valne. New "Strikes" and mportant "developments are daily reportad. Indeed, on this uido of the hountnins, copper is a decided favorite over both gold and silver. Its valin "fect," however is not yet fully appreciated among speculators on Lontgomery street. The mines exist, nevertheless, and the work of de-
elopment in being pusted with a vigor never excelted in any previous aning operations on thes coart.

## WASHOE STOCK REMARES.

$$
\text { For the week ending April } 30,1863 .
$$

There has been no lack of excitement in the Stock Barket, during the past week. A general improvement has been noticed in most Stocks, and important advances in a few. Gold Hill still presents the ohiof feld of attruction. The developments in that quarter are of a mnst exciting character, and the tendency of all Gold Hill Stocks of Betablished value City. We have full reports of th: market to Monday Eveping.
The Fnterprlse of Monday, April 27 th, remarks as follows of the Leon and Koh-j-noor:
The Lean and Koh-i-noor, the latter claiming what is known as the Belcher ledge, have been the rage to-day among the Gold Hill claims. The

Leon ajjoins the Beteher ledge on the north, and its advance in the markot bas been unprecedently rajld, even iu this combtry of fuctuatlons. Six weels apo it could have been bught for $\$ 1$ jer foot: four days since it When

Uwerman has mot with a materindadvance durlug tho wedk. Stareing at Stô © 60 on Munday, it reachel 875 on Wrednesday, atvanced to $\$ 100$ on Thursday aud was quoted at \$150 to 165 on Monday April 27 th.
Belcher is still in high favour. This sitock hase gone up within about two weeks from $\$ 50$ to 8560 and $\$ 300$. The developmenta in this mine are of the moat grutifying character. Were the ledge from which the ore is now taken through the works of this company without dispute, it would very evon cominra and a first-clasy price in the market There was some furthe exditement touching the Beleher, on Thursday last and it may be quoted at $\$ 000$ per fuol.
Bultion was largely deall to tho firat of the week to fill extensive ordorno On Thuraday it had advauced somewhat, and wats quoted at $\$ \$ 5,30 \mathrm{ds}$. On Monday last it was atII in Hpely demund at $\$ 55$ (9) 60 . Our Washoe Pony Roport, duted Thuraday last, quetes a still further advance to $\$ 85$.
The Princess has been quite a sharer in the avimation of the past few days. It was only fu quiet requeet at the commencement of the week, some uneasiaess being felt with regird to its suil with the Yellow Jackel. On Thursday tho report of a probablo compromise with their sult, added to the favourable appearauce of the mlae, improved the feeling with regard to it, and on Smaday we flud it quoted at \$15 @ 50 . Ou Wodnesday last it had advanced $\$ 60$ @ 65 .
The Union has a ko been a sharer io the excitement. It was sold on the murning of Monday at $\$ 25$ to 27 . Exciting reports coming in from the mive it was soon in lively request at $\$ 45$ @ 30 , at which figures it closed the week.
Yellow Jacket has experiencel considerable fuctuation. It commenced the week at $\$ 376$, and gradualiy advanced to $\$ 525$ (a) $\$ 530$ on Thursday nad closed at $\$ 475$ (3) 405. Our Pony Report of last Thursday leaves ic at $\$ 510$. The tranaactious have been light.
The El Dorado which had been quiet during the first of the week began to come in for a considerable share of attention with the fadications of a dear approach to the lead in their lower tunnel. On Saturday it wan quite lively at $\$ 75$ (3) 80. On sfonday last they struck their ledge, and holders were stiff at a largo advanco over previous quotations. Our Pony Report of Thursday quotes it at $\$ 130$ © 140-au evidence of a good ledgeat that depth.
The Birdsall, adjosing the EI Dorado on the south, was materially influcoced by the advance of the latter, and is tending rapidly upward. It was quoted on Monday al $\$ 65$ @ 70, with IIttle In market. This is an advauce of $\$ 25$ over previous quotatioas.
Belvidere has advanced within the past week from $\$ 20$ to 65 , probably thrnugh sympathy with the Chollar and Potosi.
Sacramento, which was lanpuishing during the woek previous, rallied on Monday last, add was quoted at an advance of $\$ 2 / 23$ (a) 4.
Badjazet \& Golden Era has lluctuated greally during the week. It was considerably dealt in on Thursday, opening at $\$ 30$, it advanced to $\$ 45$ (6) 60 and declined at night to $\$ 30$ (9) 35 . It was atill declining on Monday and now remains at previous quotations.
Gold Hill, Nos. 1, 2 \& 3, were iu bith demand on Monday. On Tues day they were quoted as follows:-No. 1, $\$ 525$ ig 650 ; No. 2, \$350 (3) 875 ; No. $3, \$ 175$ (3) 200 and No. 4, at $\$ 160 \ln 175$.

We refer to our stuck list and Wishou letter for further and later infor. mation by Pony.

Virginia City, Thursday, April 30, 1863. This disposition manifested ou the pert of capitalists to invest in Washoe Stecks during the past week has been unparalieled in the history of this country. Even the wild faror of the spring of sixty preseuted less activity in Nevads stocks than the present weak. Howover, oporations are made with a greater degree of caution and more gencral surety of success. The developments contlaually being brought to lightare of such character as would secm to warrant almost any reasonable invertment. The oro haisen from the Kolu-i-noor or Belcher is quite equal to that of the Ophir or Gould \& Curry aid the ledge appears not less formiduble.

pany need apply.

## WHEELER'S <br> Amalgamating and Separating Pans,

It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for trituratiog and amalgamating purposes to any other in use.
The most important principle connected with the ope-
ration of these Pans is the separation of the triturating process from thrit of extractivg the amalgam from the eand. The chiel cause of loss of che precious metals arises from the passing off of the same in combination with the quicksilver, iuring the proces of trituration, and in
cleaning up. By the introduction of the Separating Pan cleaning up. By the introduction of the Separating Pa working these machides there is no appreciable loss quicksilver, and hence none of the precious metals.
Where these Pans have been introduced and operated by the side of others on sauds from the same Fat, the
Wheeler Paua have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed
**: These Pans man be seen in daily operation, at the Miner's Foundry on First street in this city, where at interested are invited to call and examine for themselver. nol6-tf ZENAS WHERLER.

## SPECIAL NOTICE.

We wish it distinctly understond that all the interest hich Julius Silversmith ever had in the Mining and Screnific Prfss, ceased in Nuvember of 1862. Ewrr \& Sidith re now the publishers and proprietors.

## NOTICE

With the present number, we forward bills to those of or subscrihers whose names were handed over to us by the ormer proprietor of the Press. We have made out the acounts as we find them on tho books, and will correct anyerfors which may be pointed out. We trast our interior subcribers will recognize the importance of an immediate atention to the matter, Subscriptions can be enclosed, in old coin, within a letter, and forwarded through the Postffice. All such letters should be "registered," when they an be sent at our risk. When it is impractical to send the rect amount of the bills, we will give credit for whatever mount it may be convenient to forward, and will enclose ccoipt in next paper; or the exact amount may be sent in old or silver coin through Wells, Fargo \& Co's Express.

## CHEMISTRY.

No branch of science has made more rapid strides within he past twenty-five years than that of Chemistry. The disoveries in this science are yearly adding immensely to the odastrial employments and productions of the world: The hanufacture in the United States of articles strictly classed s chemical, exclusive of paints, varnish, white lead, perinmes, cement, etc., amounted, in 1850 to about $\$ 5,000,000$. Hince that time these values have been vastly increased; how huch will will not be known uatil the final publication of he census report for 1861.
This branch of science is yet but in its infancy, and is usceptible cf almost unlimited extension, and application o the creation of asefal articlea, largely from the refuse of -very other manufacture, but chiefly from the diversified products, vegetable, animal and mineral of our own and othIr lands. Many of the chemical branches, apart from the money value of their manufactures, are of the highest ecahomical importance to our national incunstry.
Perbaps the most important of the results of Chemistry fluring the last decade has been those in connection with the manufacture of Petroleum. The late discoveries of immense feposits of this mineral oil, and the skill with which the chemist has manipulated it, has resulted in building up an patirely new, large and lucrative branch of business. Chemstry has as yet revealed but a tithe of the wealth of its veat resources.

Conneotycet Tobacco.-A About one hundred and fifty tons of Oonnectieut-river tobacea have-reeently been shipped from and above Hartford, through the agency of a Springfield man, to a house in New York, for the French Government.

## THE MEXICAN TRADE.

The short sightedness of our trans-montain neighbors in therr late l-gislative attack upon San Francisco capital seekiug investment in Washoe, has resulted in turning much of the mining capital of this city into quite a new channel. Although this unfriendly action proved inoperative, for the time, in consequence of its o'erleaping itselt, it has nevertheless had the effect to so disturb the confidence of capitalista here, in the legislative action of that region as to enduce a large diversion of capital into another direction, and into a region which, according to present appearances bids fair to prove an equal to Wa-hoe.
In striking contrast with the action of our neighboring Territorial Legislature, may be placed the liberal enducements which the Mexican Government is holding out to attract thither foreign capital for the development of its mines. The large amount of capital now seeking investment in Mexico will soon Americanise the northern border provinces, and bind them to us by the strongest of all ties, those of con-
sanguinity and interest. The most casual observer of ey sanguinity and interest. The most casual observer of events cannot fail to notice the rapidity with which the new born trade with Mexico is growiuginto an importance of the first magnitude among our California commercial interests. The steamship line which, buta few months since, was put on as an experiment now finds it absolutely impossible to transact all the business which is crowding upon them. Every available space on board their ships is crowded with freight and passengerc. Sailing vessels have also been put upon the route, but the demand for freight and passage is still in adrance of present facilities. So great is this demand that unseaworthy vessels have been employed, and others so overcrowded with deck loads, that the insurance companies have refused their protection, until a portion of the same
has been again replaced upon wharfs to await subsequent has been again replaced upon wharrs to await subsequent ginuing to be looked upon with about as much interest, and attended with nearly as large crowds as the departures of the Atlantic steamers.
Many of our most prominent citizeus and capitalists have embarked in the enterprise of re-opening these old mines. Among the departures by the last steamer, we notice the name of Judge Sherwood, one of California's Pioneers. He took with him men and machinery to work the Soyota Mine, in Sonora, of which he is Superintendent. The field of operations in this region is not less extensive than that upon the Fastern Slope, and is probably fully equal in value. Many of the Mines in Northern Mexico are known to be of extraordinary richness. They were opened and worked at a time when the knowledge of mining was exceedingly imperfect. The steam ergine was a thing entirely unknown to the operators in the mines, and even the ordinary windlass was a labor saving invention, which if known to theon, was entirely ignored, for we read that all the ore was packed out of the mine, up perpendicular steps by manual labor. When water was reached the mine was very soon abandoned. Notwithstanding all these draw backs immense fortunes are known to have been extracted from these mines. Such be-
ing the facts we may resonably expect most extraordinary
results from the introduction of modern improvements, and Yankee skill and energy. With these advantages we hazard but little in saying that this new field of mining enterprise will soon equal, if indeed it does not surpass any other mining field in the world, in productiveness. The Sierra Madre is one vast series of silver mines from South of Darango and Sinaloa to the dividing line between Mexico and the United States; while the Coast region and the Peninsula of Lower California re equally rich in both copper and silver. But a very few only of these mines have yet been opened; thousands are yet to be brought to light by the tireless exploriug evergies of the universal Yankee whose tide of emigration has now been turned in that direction.

All this region is destined to become commercially tributary to San Francisco. The channels of trade on this coastare as fixed as are the channels of our rivers. Legislation cannot alter them. Neither state lines nor international boundaries can turn them. The efforts of legislation in Nevada bave but checked the flow of capital thither for a time, injuring that territory to the amount of millions, but realy benefiting San Francisco, by causing an overflow of capital in a new direction and opening up a field, which might otherwise have remained fallow for years. San Francisco wishes no ill to Nevarla, but rejoices as much in any degree of prosperity which may attend her, as she does in that which may attend any portion of the Pacific Coast. If Nevada wishes to develop her own mines with her own capital, it is well. San Francisco will seek other fields. We have them, both rich and in abundance. However and wherever communities may grow up on the Pacific Slope, physical and geographical conformations must so regulate the channels of their trade as to make this city the common centre and radiating point. There is not ten miles square of land from Central Mexico on the south to the northera line of the British Possessions, and east. to the dividing ridge between the Atlantic and Pacific oceans, in whose prosperity San Francisco is not pecuniarily interested. Without a rival from the Fquator to the North Pole, she sits in her glory the complacent and benignant queen of the entire Pacific Slope.
The Hesperian.-The May number of this excellent monthly came duly to hand. It is filled with the थsual vaxiety of valuable and interesting matter, embellishments, ete.; not forgetting the welcome paper pattern-welcome to the laladies, at any rate. The magazine is now under the Editorial charge of Mr. and Mrs. Strong, who are assisted by an able corps or contributors.
Thm Pacifie Rerew for May, has also been received. This numbenis enbellished with a most truthful and life-like portrait of Rev. Dr. Wadsworth. The Pacific Review is a periodical of which California may well be proud.
Pgst-office at Chifton.-A Post-office has been established at Clif!on, Reese River. People writing to their friends at Austin or Clifton, should address their letters to the latter place instead of Jacobsville.
Patent Granted.-Mr. E. Liliott, of Petaluma, has received letters patent or a pump recently invented by him. This pump is said to be a most important invention.

THE MINERS' I.ABORATORY-NO. II.
We have alpeady described a minerrclas an unorganized body, formed and enlarged by an increase of particles, externally, said particles being attatched by mere juxtaposition instead of assimilation as is the case with veg etable and animal organism. All solid substances therefore which possess neither vegetable nor animal life are mineral. All rocks, are minerals and the chief part of soils are mineral.
When a mineral has a metal of any kind associated with it, it is commonly ralled an ore-as an ore of silver, an ore of lead, copper, etc. Ores are usually found in veiss, sometimes however in beds. A mineral bed usually lies horizon tally, or at a very slight inclination. Lead, zine and iron are often found in beds; gold, silver, copper, mercury etc., very seldom.

## mineral veins.

We propose in this chapter to treat principally of mineralveins. A mineral vein may be described as a fissure or crevice in the earth, more or less vertical, and filled with some kind of vein-stone, utually quartz, more or less mixed or impregnated with various metals, and when so mixed called ores. Most metalliferous veins contain several varieties of metals. The veins of California and Nevada territory probably contain a larger variety of metals than those of any other portion of the globe. Veins vary in width from a fraction of an inch to one or two hundred feet. They usually range from 10 inches to two or three feet in width. Of the origin of veins and the manner of their being filled, there are various theories. The opinions of practical and scientific writers on this subject are quite various. Some attribute these fisures to a process of cracking or opening of the earil in long fisures by some interior power of upheaval ; others attribute their formation to a contraction of the earth's crust in the process of cooling or chrystalization; others again suppose them to result from the action of electrical currents. Their manner of filling up is also a matter of great diversity of opinion. Intrusion, sublimation, deposition, infletration from water, electrical agences, etc., are among the most commonly entertained theories. The probability is that all the agences named have contributed at times and in part in a greater ar less degree toward preparing these valuable deposits, so indispeusable to the progress of civilization and the arts. Our present purpose, however, being to treat upon facts, we shall wave all theorising for the time being, and confine our remarks to simple facts and positive instruction. In futare uumbers we shall probably have something to say on the various theories above alluded to.

## general laws of teins.

Whatever their origin these veins (or lodes as they are sometimes and perhaps more properly called) are, as a general thing, found to obey certain general laws. They are usually contained within clearly defined walls, and are generally found in "setts" or "classes," each individual of any given sett being approximately paraliel to all others of its class. The different setts usually give evidence of different ages, the newest sett being found to have disturbed or displaced the older in parsing across it. The different setts are usually known by the general line of their direction as the "East and West sett of veins" or the "North and South sett of veins." They are usually found most productive near their crossings, also at any point where the vein enters a new - class of rock, a change in its mineral productiveness may bo most confidently expected. The point where a "leader" o "string" comes in is usually improved by such contact. On the other hand a sudden enlargement of a lode, where it is not caused by the consing in of a feeder is almost iuvariably attended with comparative barreness. Thelscattering of a lode into a number of small ones is also almost universally unfavorable. They are, of course, of more recent origin than the rock which they traverse, though their general characteristics and richness in mineral is often much affected by their passage from one class of rock to another. This latter fact would seem to imply that, to a certain extent, they are dependent for their mineral value upon the mechanical condition of the rocks which they traverse.

## troe telis.

As we have alrearly stated veins or lodes are found traversing all kinds of rocks, stratified and unstratified, often
found to traverse a space between two classes of rock, as between the slate and granite, metamorphic (rock changed by heat) and unchanged rock. Veins of this description are usually called "true veins," because they are much more reliable, more clearly defined, of greater linear extent, and generally much larger than veins having both walls composed of the same kind of rock. It is reasonable that these conditions should usually accompany veins of this descriptioninasmuch as fisures betweeu walls of dissimilar rock would naturally present less obsiructions and disturbances and be more continuous in both length and depth, than fissures forced through a homogencous mass of rock. True metalliferous veins are almost uniformly much more productive than other veins in the same neighborhood. The Comstock vein, in Washoe, is of this deseription. This is a condition in regard to quartz veins which should be more generally considered than has heretofore been the case in this country. It will, wherever it exists, be found to exeřt a most important influ nce on the productiveness and consequent value of the vein.

## igneods indications favorable.

Valuable metalliferous veins of ore are often found in secondary and even tertiary formations, yet as a usual thing they are found more aniversally productive and most reliable when they occur in the older and metamorphic rocks. We have the prool of this in our own state and adjoining territories. Those portions of California and the Eastern Slope, where is found the strongest eviderce of ancient igneous action, have as a general thing proved most valuable in mineral developments. Indeed, the idea has been advanced by some, that no metalliferous veins exist entirely disconnected with igneous rocks. It is claimed by the advocates of this theory that whenever surface indications are wanting, metamorphic rocks will invariably be found at no great depth below.

## pectulartities of quartz vetns.

The study of qaartz veins, to the mineralogist and miner, is most interesting and inportant, and one to which quite too little attention has been devoted in this country. In the hasty summary we are now giving we cannot do the subject that justice which its importance demands; but in future numbers we propose to come back to this head and treat more fully upon it .
Few veins exhibit their true characteristics upon the surface. The action of water and the atmosphere, resulting in the oxidation of much of their contents, and other disturbing influences upon and proceeding from the surface, not unfrequently lead to serious fallacies in judging of a vein in the early stage of its development. An important consideratios in the study of veius is the changes which they undergo in their passage from one class of rocks to another. This matter, so far as we have learned, bas never been much considered on the Pacific Slope, although it has long been acknowledged as one of much importance in nearly all other mining regions. We append the realt of a few ubservations under this head from various authorities.

De la Beche in his survey of Cornwall says that granite and its modifications is always found near or at all lecalities productive of paying tin or copper mines ; while lead, anti mony, iron and zine are found independent of and at a distance from granite.
In the Hartz mountains, veins passing from hard to soft slates lose much of their productive character; hard granites, as a general thing, are also found less productive than soft, or decomposed descriptions.
In the Copper mines of Lake Superior veins in hard greenstone are usually contracted and comparatively barren; but the same veins on entering the granular trap, a much more yielding material, become at once expanded, and inproved in yield. This is especially the case with the celebrated Cliff and North American mines. The Copper Falls mine is highly productive and well defined in the trap, but on entering a belt of sandstone the vein is contracted to a mere fissure. Nearly all the veins of the Lake Superior region traverse different mineral planes, and in their passage through them are more or less modified, as noticed above. It will be perceived that instances above cited confirm the correctness of our previous remark with regard to the favorable nature of igneous rocks in mineral localities. We shall resume this subject in our next.

## THE SUPERHEATED STEAM PROCESS.

We have alluded once or twice to a process in operation in this city, fur the extraction of gold hy the use of superheated steam, and have wiluessed the operation on several occasions. We understand that several of these ma chines have been ordered by parties who have thoroughly satisfied themselves with regard to the completeness of the process, and the machine will soon be surjected to a practical test both in Washee and this side of the mountains. The process is the invention of Prof. Ryerson, of New York, a a gentleman of large and practical scientific attainments, and is already in successful use in the mines at Pike's Peak. It is claimed by the inventor, and with good show of reason, that with the tailinge from ordinary machinery a large amount of gold of the most minate microscopic fineness is constantly washed away, which can be readily taken up and saved by this machine. We can see no reason why every particle of liberated gold, however fine, may not be taken up by this process. We shall soon be able to give our readers the results of the practical trials to which the process is about to be subjected at the several points above alluded to.

Tie Business of Gathering Pitch. We learn from Mr John Hart of this city, says the Marysville Appeal, that be has a large number of men engaged in tapping trees for pitch, in Butte county, the best points found yet being about two miles this side of Dogtown and at Nimshew, fonr miles. west of Dogtown.-He has eighteen thousand trees tapped, averaging two cuts or boxes to the tree, and making an ag:gregrate of 36,000 boxes. His workmen are now cutting 500 additional boxes per day. Fifiy-eight barrels of pitch of 42 gallons to the borrel have been brought to town thus far this spring. and from this time it is expected the average amount received will be 25 barrels per week.

Effect of Shot on Vessels.-A shot does not make a hole of its own size right through the wood, but indents it, the fibres springing back after the slock. Generally the course of a shot can only be traced with a wire, sometimes with a hole as large as a man's fliger. The damage most often happens on the inside of the vessel, in splintering and breaking the wood, after the main force of the shot is speut. There is rarely an instance where a ship was sunk by a solid shot. Hot shat and shell do the mischief. This latter will! sometimes make apertures of several feet through the sides of vessels.

Slers of Steam Cylinders.-Much confusion and popu-1 lar iguorance exists upon this point, and errors of statnonent are continually made respecting this or that steamship or boat. There are two vessels building in New York-one an iron-clad battery, the other a North river steamer; the iroul clad will have two cylinders each 100 inches in diameter by 4 feet stroke of piston ; the latter vessel will have one cylinder 83 inches in diameter and 16 feet stroke of piston The largest steam cylinder in any steamboat or stean vessel in this country, is 105 inches; the cylinder of the Metropo-lis-a Sound boat-is of this size, as are also those furnished to the Golden City (now building, and the Constitution belouging to the Pacific Mail Company; these vessels are the only ones that have cylinders 105 inches in diameter.

Interesting to Bonler Makers.-According to the expen iments made by Professor Fairbairn, the law of resistane; for cylindrical tubes is this: A tube having the same strengtl of material, and being of the same diameter, will resist doubl the pressure to one of double the length; or colapsing power other things being the same, varies inversly as the lengtl and inversly as their diameter. Fxperiments made with ell iptical tubes showed that in every coustruction where tubel have to sustain a uniform external pressure, the cylindrical i the only form to be relied upon, and that any departure from the true circle is attended with danger. The experiment also tend to confirm the conclusions heretnfore arrived a namely, that the strength of rivited joints of malleable iro plates are nearly as the numbers one hundred for the plat, seventy for double rivited joints, fifty for single rivited jointi

Present indications point to a most abundant harves throughout the State.

The Fisolis Iros-clad Fbigates-Fune of these vessula have returned from their experimental voyuge to Portigal, and the naval report of the I Andon limes says that the plates aro locse, and that the vessels are not in a condition to ga nut tusea now. 'The impressiun of the writer seems to bn hat the fastening of iron plates to the woolen hull, will not Luswer the purpisass desirud. It appears as thuagh our! lit He flept of Munitors were the mist furmiduble iron-clad fleot alluat.

Trbasure Simparnts.- During the present year, up to the Both ult., $\$ 15,892,10374$ in treasure hads been shipped from pin Francisco, smilfor a corvespondiug period of time last $10,865.760 \quad 92$ was shipped-showing an increase of xpurts for the preasent yoar of over $\mathbf{5 , 0 0 0 , 0 0 0}$.

A Powerrus, Sinp-Tho Royal Oak, an iron-cased ship, is
 nonth. Her elggine is of 800 horse power, und sho is comIntoly covered with four and it half inch armor, and has a areet shot proof, whone: the captain direc's all operations means of Gishorn's telegraph, wheh commanicates with ho engine-ronm and stearime apparatus. Her armament onsists of 32 68-pounders, and two Armstrong 100 -pounfers; and the bow is constructed so that she cin be used as ram.

Wiruis the last gear over $\$ 8,000,000$ in gold dust has een received at the New York assay offices from Pike's P'eak.

## TO MLNERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable hineral deposits, other than gold, in almost every section of the stato, which have of late been made, it is but reasonaple to suppose that prospecting even in California, has but fust commenced. The simplest and most universal of all netaliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to he naked eye. An examination of any rock or earth for rold is 20 extremely aimple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a nan is an invariuble te.t. If in rock of any description hal rock pounded fine in a mortar and washed, in the same banner as alluvium, will usu lly expose its gold to the nafed eye, if there 18 any there in paying guantity. The only exceptions, are where the gold is contained in iron pyrites, fr copper pyrites containing also iron. In either of the Iwo latter cases the presence of gold may be readily ascerlained by placing the pyrites in any suitable vessel and ) keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur f will be evaporated, and the copper, if any is present, clanged to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.

Not so with othermetals. Silver, copper, ziuc, nickel, and many others appear in such a great variety of metalifrous forms as generally to defy all but the most pracrical Fnd scientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. Alter reading descriptions, however, and carefully examining the specimens kescribed, the explorer may go out and search with some degree of confidence and intelligence. A study of the char-- acteristics of the sulphuret ores alone, would lead an exPlorer to pass over, entirely unnoticed, the mehest värieties of the ores known as Chlorides or Horn Silver, which, from the facility with whicb they may be worked, and their usual richuess, are generally considered the most valuable of silven ores. There is much reason to believe that this variety silver ore will be extensively found in all the volcanic gions of this State. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the developnient of our mineral resources, we hereby make
the offer to miners, prospecturs and all others, who in their travels or explarations iusy como acruss specimens having the appearance of mority or value, to carefu'ly examino and pronounce upon the same, free of charge, as to their char-ucteri-tics, value, etc., whenever any such specimens are brought or sent to this oflica free of cust to us. We bave already been called upon in many such cases, and we shall at all times bo willing to give our attontion to any such requests which may bo preseuted to us.

Our object is to furnish the miners of California with overy class of information which shall be valuable to them in the progress of their calling and in the developent of the mineral resources of the State, and we know of no way in which we can derote a portion of our time more to the interests of miners than in the manner here proposed. 'I'he only equivalent we ask is that they shall do what they reasumahly can to sustain and improve the paper devoted exlusively to their interests.
In carrying out the plan we propose, every miner and prospector should he at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusucal apperrance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzoze nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place." and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be valun in it, although the gold may not shine there. We shall commence in our next issue a sories of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notic of the California prospector; and we have the promise also, at an early day-prohably within a week or two-of" a series of articles, under the head of "The Mrner's Laboratory," which will be prepared especially for this paper by one of the most skillful me'allurgists on this const, and which will be found of great value to the mining public.

## notice.

Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.

Subscribe.-Are you a miner and not a subscriber to the Mining and Scifntific Press? If so, you are an annual loser of many times the price of \& year's subscription, particulurly if you are engaged in quartz mining. The same amount of practical information, important to miners and meshanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper' to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no papfr that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Par cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months ; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontre the paper after being a constant reador of it for evea that short period.

## PROGRESS OF THE MINING INTEREST.

The encouraging reports, noticed for a few weeks past still continue to come in. From every direction we hear that the miners are doing well. Progress and development appear to be the order of the day. The important results so generally obtsined from those mines which have been properly opened on the Lastern Slope, is exerting a marked effect in urging on the development of many, which have hertofore remained quietly awaiting the results of uther operations in their neighborhood. From Esmeralda, from the Coso region, from Humboldt, from Reese River, from Virgibia and its surroundings, we hear but one report, and that of the most encouraging nature. The Reese River miuers, satisfied from the developments at Humboldt, are already fully at work taking out rock to be in readiness for the mills which are now in progress of erection in that neighborhood, and according to present appearances will soou occupy a prominent position among the various mining localities on the Eartern Slope. There seems to be a growing coufidence in these mines, as well there may be, if they yield any considerable quantity of ore like samples which have reached this city. The cities and towns in California are losing a large amount of population and considerable money in consequence of these tate new and excensive discoveries, but we shall soon begin to get ample returns, especially in this city-for whatever wealth may be gathered up in those regions must flow into or through San Francisco before it can reach the regular channels of trade.

The rush over the mountains at the present time is without a parallel in any former period of the history of silverland. The hotels are crowded with guests, the hills and gulches covered with prospectors and the streets of the principal towns with buyere of "feet."
The Enterprise of Virginia City estimates the present weekly transactions in the Mining Stocks at the various Stock Boards in that city at from $\$ 600,000$ to $\$ 800,000$ exclusive of outside transactions which are set down at $\$ 75,000$ to 100,000 weekly.

## esmeralda.

A correspondent at Aurora City, under date of April 30 , writes as follows :
The "Gen Hooker" Ledge sitnated on Silver Hill between the Utah and Antelope is turaing out gond pay rock. The shaft is down about 35 feet and the ledge averages three feet in thickness. The company are prosecuting the work vigorously and have taken out about 60 tons of rock which will be crushed immediately.

The "Junlata" Ledge situated on Martinez Hill is one of the oldest discoveries in the District. There are two shafts suak on the ledge-one 60 feet in depth, the other 97 feet. The rock is similar to that of the Wide West, on Last Chance Hill. Eleven thousand dollars were crushed from this ledge during the winter of 1862, but the clain has been lying idle until the last menth. It is now incorporated and will be vigorously worked during the summer. A specimen of the rock can be seen at the Pioneer Club Rooms, San Francisco.

The "Mina Real" Ledge, situated East of the Pond and Aurora is being vigorously worked by the Company. The main shaft is now down to a depth of 40 feet and the Ledge is over three feet thick. "The ruck is similar to the Pond and Garabaldi. There are about 45 tons of rock taken out which proves very rich.
The "Alpine" Ledge, situated on Middle Hill, is being worked, and tbe rock prospects rich in both gold and silver. The shaft is down to a denth of about 30 feet and the ledge is about $2 \frac{1}{3}$ feet thick.

The "Great Britann" Lead is one of the oldest locations on Middle Hill. The new shaft is down to a depth of 50 feet. The ledge is over four feet wide and the rock is similar to the "Pacific" on the same Hiil. The Company have 100 tons of rock taken out ready to be crushed.

The Esmeralda Star of May 2ud gives encouraging necounts of the progress of the work upon the Peck and Rowel Lode located on Silver Hill. They have a 4 -foot vein in a shaft 25 feet deep, improving as they descead.
The Paul Tunnel, on the same hill, is now in 150 feet and making good progress.

The Ruth Windsor Tunnel, on the same hill, is in over 100 feet.

The Mansote Tunnel, on Middle Hill, is in over 275 feet. This is the largest tunnel in the district, being 8 feet wide and $71 / 2$ high, designed for a double track. This and the two previously noted have large and valuable claims for which they are running.
The Star also notices progress on the Bright Star and Aurora Borealis Lodes, each of which present encouraging indications.
The Pride of Antes,ope is yielding rock very much like the main Antelope. 'I'he Cumpany hold 800 feet of ledge.
The New Esmeralda Company are pushing their work day and night and are expecting to strike another large lode in a few days.
SoL Letyis looks exceedingly well, and is being worked constantly. A new shaft is down and the rock looks very handsome.
Mt. Bradey is progressing finely; a tunnel is now in one hundred feet, and if the work is continued, day and night, they will reach the ledge by the first of June.
The Liny Dale have sunk a shaft upon their lode, and are taking out rock.
The Pride of the Wide West have sunk a shaft and struck a good looking ledge.
Washoe.

The reports from Virginia and the neighboring districts are losing none of their interest or importance. The confidence which operators there have in the value and permanency of the mines is sufficiently indicated by the heary stock transactions above alluded to. The chief interest, at the present time in that region appears to be centered in and about Gold Hill, where mustimportant developments are constantly being made.

The Monfror District,-Exciting reports have of late been coming in from the Monitor and Peavine Districts. The former is located on the Last fork of Carson River. Gold appears to be the predominating mineral, although quite a namber of ledges are being opened which indicate much value in silver. A great number of ledges have been located in this district, nearly all of which, so far as developments have been made, are exceedingly promising. The lodes are generally very heavy, and are in the hands of hut a very few individuals. The Monitor men acknowledge that there are ledges in the Territory which assay better to the ton, but they hold that no entire district presents better indications. They have also a very important advantage in having an abundance of wood and water to say nothing of excellent coal indications.
Adjuining the Monitor is the Alpine Distrigt, which preats the samegeneral characteristics with the Monitor.
The East Fork of the Carson, in the immediate vicinity the mines has a rapid and very even fall, affording a large number of most excellent mill sites. These mines are in a direct magnetic direction from Virginia City and are supposed to be a continuation of the same series of ledg a, which appear there. The ledges, which are large and well defined are ustully foubd on high and narrow hills, affording most excellent facilities for drainage and working. There is much reason to believe that this will soon prove very valuable as a mining region.
mining in californla.
The great rush over the mountains, caused by the recent extraordinary developments in Silverland, is being sensibly felt throughout the interior. Many of our mountain towns which have for many years been improving, with a steady increase of population, have come to a sudden stand still, and some are eyen on the retrograde. Of course such a state of things will be bat temporary. Of the many thousand now on their way from the East, but comparatively few will tarry on the other side of the mountains. The great bulk of the immigration will find its way into California and serve to fill up the gaps now vacant by the absence of the silver hunters.
The Copprar Exorfement is also operating to a considerable extent in checking the movement Eastward, by opening up new fields for exploration at home. A large number of miners are now actively engaged in developing this new interest, with most flattering prospects of abondant success. The copper mines which were first opened are mostly in the hands of a few individuals, who are quietly prospecting their work without availing themselves of the benefits of the Corporation Act. It is well koown that several of these
companies are already realizing large profits, while, if we are to judge of the recent advance in the price of "feet". in some of the incorporated companies, we shall soon be able to enroll several of these public institutions under the head of "Dividend Paying Mines."

Gold Minta.-In the present excitement with regard to silver and copper, our gold mines have been almost outirely igoored, and it is only now and then that the eye falls upons a paragraph in an interior exchange, announcing a new gold strike or an extraordinary "clean up" of that once predomi. nent mineral. Still the few paragraphs of that kind whith do come under our notice are quite sufficient to assure us that the gold mines still continte to "give out" their accnstomed yield. It is to be feared that capitalists in this city are not giving the mines within the State limits, that degree of attention which they merit.

Copper Smelming Works.-The Cali. Copper Co. will be ready to commence smelting in about two weeks. They advertise for ores, which they will purchase on delivery at their wharf at Antinch. Propositions for purchase will be entertained on ores of any grade above seven and a-half per cent.

It is said that some of the most dislinguished engineers in France have approved a plan for a railway from Paris to Mar. seilles, by which the journey, which now consumes 18 hours, may be made in 1112 hours. The distance is 510 miles. The plan has been submitted to the Emperor for his approbation. The hydraulic system, in which slding is substituted for running on wheels, is that proposed.

## VIRGINIA CITY STOCK LIST.

Corrected for the Mining and Scientific Press, Friday, Mny 7, I863.

## WASHOE STOCK REMARKS.

For thu wetk ending May 7, 1863 ,
The Stock transactions of the weuk have bren uncrianlly hoavy, "BC
 the supposethagergate." Money has hicen abuuanat and freely offered. A number of very mgnticant llucthatious lative bren unted, but the general tendemey of prifees fian been upward. Sume chaints, indeed, havo been douthed and even trippted. The chef interwst nufl athaches to the neighburhoend of Gold Jilli.
Biritsall has been largely doalt in during tho week at a beavy advauce. $\$ 60$ was frecly niferen at lifst, without puthers. Subsequeutly offers advanced $\mathbf{t 1} \$ 56$ and $\$ 60$, which wers accopted. On Thursday last is etood ac $\$ 65$ (a) $\$ 70$

Burnsite has advnuced during the week from $\$ 35$ to $\$ 90$. This atock is prtuepaliy held in san Francisco. The cause of this audden movement is fully detailed in our San Franctica stock Remarky
Ei Dorado has been wuel deats in. There are more buyers than sellers. It has advasced during the week from $\$ 75$ to $\cdot 160$.
Allen hus gone up from 805 to 95 , nt which latter price it la saleable.
sucramato has also met with alight ad vance, although we contioue our hast week's quotation.
Harrison, Virgiula Iucorporntion, was in rlomand at $\$ 85$ (a) a7 during the early part of the week and wan dealt in to sume exteut at blese figurep,
but subequently declined to $\$ 27$. It is now, however, held firm at $\$ 37$. but without hikers.
Thu Muntour and Eij Dorado ledges have been made the subject of much proplatio speculatiou. The ledgo, by many, is claimed as the geruine Comstock ven.
Pouce de Leon appears to bo comjing into [avor. It has beon saleable duriog the weok at $\$ 9$ @ 12 , going up to that ggure from $\$ 4$. A considerable amonut has changed hamis at these figures.
Texas is saloable at \$10 (c) I2. Utah hua advanced about \$8. There has been enquiry fur Cole at $\$ 18$ to 20 , without sullurs.
GOLD HLL DIGTKICT.

There is ne apparent abatement of the exeitement witli regard to claime a Gold Hill District. Tho Market atill conthues hoth active and buoyant The transactions in shares are heavy and significant, and the eaquiry earuest.
Overman has struck five ore and its stocis has gone up from \$65 to \$225 -more than quaurupled in a week
Belcher has met with a still further advance of $\$ 150$, and is now guoted at $\$ 750$.
Bullion has been slightly fluctunting, several hundred feet having cliang. ed hands at $\$ 65$ to 80 . We quote bids at $\$ 80$, holders $\$ 00$, on Tharsiay last.
Kols-i-unn ls attracting muck attention, with no stock in the market. We quoto bids at \$250 @ 300.
Leon has been somewhat fluctuating. Its tondency the first of the week was upward, aud a still larger ndvauce was predictod within the week. These auticipations havo uot yet beou realized and we quote it at a alight decline on last week.
Culedonia has allvanced from $\$ 25$ to 35 , with demand.
Laboring bas improved during the week from $\$ 15$ to 30 -ana advance of 100 per ceut.
The Eureka, Golden EagIe, North America, Princess and [Hawkeye, have been in request at slight advautes over previous quotations.
Michigan is in demand at $\$ 50$ (3) 60. Thas is an old tocation covering somo of the best ground in Gold Hill.
devil's gatr diftricr.
The Devil's Gate District is again looking. up, and beginuing to attract much attention. The Entos prise expreases the opinion that this much abused district will olum and receive its share of attoution the coming Sum. mer
The Pride of the West takes tho lead in interest just now, having gone p during the week frons \$125 to 225 .
The Wide West also advaaced from $\$ 10$ to $\$ 12$ (a) 15, and many other clams in the district are improviag.

## WHEELER'S Amalgamating and Separating Pans,

It is acknowledged by all who bave examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amaigamating purposes to any other in use.
The most important priuciple connected with the operation or these pans is the separation of the triturating
procuss from thr tof extractiug the amalgam from the procuss from the tof extractivg the amalgam from the ser from the passing off of the same in combination with the quicksilver, during the proces of trituration, and in cleaning up. By the introduction of the Separating Pau to f.llow the trituration this loss is entirely avoided. In
working these macbines there is no appreciable loss of workng these macbines there is vo appreciable loss
quicksilver, und hence uunc of the precious metals. Where these Pans have been introduced and operate by the side of others on sands from the same vat, the Wheeler Paus bave unifornly gained a large percentage of metals over its compesitors, as well as a still larger percentage ia the amount of worls performed.
** These Pane man he seen iu daily operation, at the Miner's Foundry, on First street in this city, where alt interested are juvited to call and examine for themseives. nol6-tif ZENAS WHEELER.

## SPECIAL NOTICE.

We wish it distinctly understond that all the interest which Julius Silversmith ever had in the Mining and Scienrific Press, ceased in November of 1802 . Ewer \& Smimd are now the publishers and proprietors.

## OUR MECEANICAL INDUSTRY.

All our large machine-shops and foundries are at this time most active, and driving the ir machinery to the utmost in filling their orders. There are coutracts now in active progress of completion from nearly every section of the $P$ a cific Slope, from below Mazatlan in Mexico to Oregon on the north, and throughout every central portion, even to the distant regions of Humboldt and Reese River.

## the voican tron works.

We recently paid a visit to the Vulcan Iron Works, on First St., which are now under the management of Paul Torquer. At these works we found a large quantity of machinery in all stages of construction, from the pattern shop to the finishing room. This establishment is prepared to auawer orders of every description in the line of Steam Engines, Boilers, Foundry work generally and the necessary food-work to accompany the sume. Like all our other foundries and machine shops this, also, is crowded with business, and censtantly enlarging the area of its shop room. Their works already cover a very large area, which is reconed by acres.

This firm at the time of our visit were just putting the finishing toucbes upon one of the largest orders for mill machisery ever given out in the State. The total cost of the same was $\$ 30,000$, and the whole was finished in forty days from the signing of the contract. This machinery has been constructed for the Las Uruzecitas Mining Company, a recent organization, formed in this city, for the purpose of working a mine located about 125 miles from Guymas. Ihis is one of the old Mexican mines, worked years ago by the Spaniards and loug since abandoned for want of machinery or energy to follow it below the water level. The frachinery which has been coustrncted for this company consiats of an engine with an 18 -inch cylinder, and $31 / 2$ feet stroke; capable of being worked at 90 -horse power. This, we believe, is the largest stationery Engine ever constructed in California. The Main shaft is six inches in diameter Whare the power is taken from the engine. The mill consists of five batteries of five stamps each- 25 in all. Each stamp weighs 612 tos. The length of the engine-bed is 21 feet. The fly-wheel is 16 feet in diameter and weighs over T000 ftus. Three boilers, 42 ft . long, with five five-inch flues each and a fire surface of 960 square fect, will be employed. The process to be emplojed at this mill is that known as the "Freyberg Process." 24 amalgamating barrels will be used, capable of holding 200 Hs . of ore each. The entire weight of machinery, jucluding the wood work, which was also made at this establishment was 90 tons. It went down by the Oregon on her last trip.

A large amount of other machinery work was also in pro-
gress of construction, as indeed, is the case all the time, a this establishment. The energy and skill of San Francisc machiuists is limited only by the demand upon their effort and genius. The day is not fardistant when the machin shops of this city will be prepared to undertake anything within the range of mechanical possibilities. We propose to continue our notices of individual establishments from week to week, and shall endeavor in our progress through the various foundries and machine shops to collect a fund of statistical information, for embodyment in tabular form, which slall be valuable for reference.

We regret exceedingly that the former proprietor of the Mining and Scientific Press, could not have been allowed to rest in peace and quietness, "after life's fitful dream was over;" but some luckless wight, like "Banquo's ghost," will not down, and has set him up, with other notables, in caricature. And to further illustrate, has used the name of the Mining and Scientific Press, which paper Silversmith has had nothing to do with since November last.
At first we were inclined to be angry and kick the fellow who thus should seek to bring ridicule upon ur labors; next we thought of the law, but soon learned of the utter irresponsibility of the parties, and upon mature thought, conclusled to let the matter rest, hoping that the Artist, the Vendors, "Emperor Norton," "the Fat Boy," the "Handsome Boy" with the tooth brush, the "Rag Man" and all the others, will meet at last, where "grub" is free, with "Bummer and Lazarus" to lick the tears from their eyes.

The coinage at the Branch Mint in this city for the mont? of April was-

A communication from "J. P." at Copperopolis, came to hand too latefor insertion this week. It will appear in our next issue. The writer is a practical copper miner, and his letters will be read with interest and profit. Practical suggestions and hints are what we want, at this time, especially upon matters pertaining to the growing interest of copper mining. We are also indebted to the same party for the loan of a volume of "Eapiborn on Copper," from which we shall, from time to time, extract whatever it may contain of value to the copper miner and prospector.

Correspondence. - In order to make room for the valuable and interesting correspondence which has come to hand the past week, we have been obliged to omit our usual mining summary. Its loss, however, is more than made good by the varied and valuable mining infownation contained in our Humboldt and A mador County letters.
We would call especial attention to the letter of "Miner," which contains several suggestions worthy of thought, by all practical miners. Correspondents will also do well to consider that portion of it which relates to them. The necessity of a common medium of communication, and the value of an interchange of ideas and the results of experimental mining operations, is especially worthy of consideration. The columns of this paper are open to all such communications. We trust "Miner" who has proved himself so apt at suggestions, will not forget to put them in practice also. We infer that he is not altogher without an experience, which would be valuable to his fellow miners. Let us have that to begin with. It may serve to call forth other criticisun, or some other experience, which will be of value to the mining public generally.
Our Amador correspondent gives a very interesting description of the Oriental Copper mine, describing its varied and changing appearances as the workmen descended upon its dip. The characteristics of this vein are worthy of study by operators in other localities. Similar degeriptions of other characteristic veins, would be read with interest and profit. Copper veins present' a much wider and more intricate field of study than gold, and we should be pleased to hear from correspondents in such localities.

Our Humboldt correspondent, "Quartz," gives us quite a detail of mining progress in the Buena Vista District, and promises to furnish our readers similar information with regard to other districts in that interesting region. "Quartz" is a man who never promises what he does not intend to perform. His letters will be found always reliable.

An Item for Gray-Htads-An English writer has recently asserttd that an undue proportion of lime in the system is the cause of premature gray hair and advises to ayoid hard water, either for drinking pure or when converted into tea, or coffee, or soup, because hard water is always impregnated with lime. Hard water may be softened by boiling it; let it become cold then use it as a beverage. It is also stated that a liquid that will color the human hair blark, and not stain the skin, may be made by taking one part of bay rum, three parts of olive oil, and one part of good brandy, by measure. The hair must be washed with the mixture every morning, and in a short time the use of it will make the hair beautifully black, without injuring it.

A London paper says, at present 110 mails pass through the penumatic dispatch tube from the station to the distrct Post Office during the day, and not only letters ,but but trucks of iron of the weight of five tuns have passed through. and adventurous visitors now and then perform the joarney to their delight.

## MINING CORRESPONDENCE.

COPPER MINING IN AMADOR COUNTY.
We give below the concluding portion of a private letter from an old friend and neighbor, then, like ourself, not overburdened with this world's goods, but now owning large interests, in several of the most valuable copper mines in the State. The writer, the Rev. I. B. Fise, it will be remembered by some of our readers, was the fortunate discoverer of what is now known as the Oriental Copper Mine. Mr. F. in company with two friends; was passing along the road on horseback, when observing some peculiar quartz croppings, he dismounted and to his astonishment, found that the "croppings" before him consisted of copper ore of most astonishing richness. Of course the travelers lost no time in staking off the ground and taking the necessary steps to secure their discovery." The fact that such immense mineral wealth should have remained undisturbed and unnoticed for so many years, on the direct line of a greatly traveled thoroughfare, affords another evidence of the importance of an extended mineralogical education among the people of California. The importance and palue of this discovery is quite closely foreshadowed in the interesting letter which we subjoin. We shall be pleased to hear from our correspondent often, and to receive the promised call whenever he may visit this city:-

Jaceson, Cal., May 9, '63.
Very unexpectedly, I am involved quite deeply in mining operations. I was one of the discoverers of the Oriental Copper lead, in the Forest Home Mining District of Amador County, and am a stock holder in the Oriental Co., and in several other good leads in this county. And all quite unexpectedly. Messrs. McKim, Trowbridge and myself discovered the Oriental Lead on the 10th of Fib. last. Heavy and beautiful Gosson croppings were seen bulging out high and boldly, in a straight line between well defined, gray granular trap walls, lively with mineral sulphurets, for a distance of one hundred feet. At three different points, between the Gossan croppings, we found boulders of rich and beautiful copper ore, which had doubtless been formed by the workiug of gasses from below. [Our readers will find the probable solution of this phenomenon under the head of our Miler's Laboratory, next week-Ed. Press.] On the 17 th of Feb. we incorporated the company, estimating the value of the mine of 1400 feet at $\$ 100$ per foot. We now have a shaft down on the lode, thirty feet deep, in which, through the first twenty-five feet, we found ulmost every variety of ore except the solid oxides and sulphurets. At the first we found most beatiful malachite, then the red green, and blue rock ore, or "horn blend," which assayed at Molitors in San Francisco, 421/2 per cent copper, and also beautiful masses of solid green sulphate of copper. But at the depth of twenty-five feet these variations gave way to white, solid, live mundic, a vein of grey copper ore, and a black vein with silver lustre. Of this latter we had a piece assayed at Molitor's, which to our surprise yielded traces of gold, $\$ 6237$ of silver to the ton, and $153 / 4$ per cent. of copper. Now at the depth of 30 feet we have a vein of 6 feet in width, of solid grey, yellow and black oxides, and sulphurets of copper, with a vein of grey silver ore with apparently little traces of copper next the east or head wall. In all a vein of saleable ore, eight feet in width, and widening. This is a most remarkable mine and now its real value is more than that put upon it in the incorporation. The office of this company is in Jackson. Wm. L. McKim is Sec.

The Cosumnes company, also incorporated, hold 100 claims of 200 feet each, of twoleads, running west of and parallel with the Orieutal. They also have an immensely rich mine. Have already out several tons of first rate ore, of almost every known variety, and are now making shipments. There are also several other companies in that district, opening onto splendid ore-one of which is the Exchange company, on the Ledger lode. A dozen or more companies have splendid prospects.

Of the Newton Co. near Ione Valley, I may write you soon. This mine is opened to the depth of nearly 200 feet, and is proven rich beyond calculation, and apparently inexhaustible. In it copper was first struck at the depth of about 75 feet. I caunot now, but if you please I will as
soon as I can gather together the facts, gire you a more
particular account of the number and value of copper claims, and mines in Amador Co. I. B. Fise.

## COMMUNICATION FROM A PRACTICAL MINER.

A practical and intelligent quartz miner operating near Virginia City, writes as foffows:-
Editor Mining and Scientific Press :-I notice a large amount of "Mining Correspondence," published in the various journals of your city and in papers, generally, thronghout the state, but it is seldom that these communications contain anything beyond mere common place remarks about the general appearance of the country, an enumeration of a few companies or claims, in which, it is presumable, the writers are more or less personally interested, and perhaps the announcement of a new discovery ic the neighborhood where the letter is dated. The information usually contained in those lettees is of little or no practical value. There are two classes of information which are especially valuable to miners and persons, interested in mining operations.
First, the miner is anxious to gain some practical juformation with regard to the various processes of working ores, and to leara the indications by which these ores and minerals may be discovered and made known to the prospector.
If miners would communicate through the Press, their experience in working the various kinds of ores, and thas compare notes with each other, the result would be the diffusion of a vast amount of information which would be of much practical value. Now why is not this done? Whenever three ar four mill men or mining Superintendents meet, the subject of their mutual, indiridual experience, is almost sure to form an important topic of conversation. What man is there, who does not admit that he gains a large amount of informa:ion in visiting different and distantmining localities and comparing notes with others engaged in the same class of operations? Why not then make this $\Omega$ subject of ointercommunication through the press? There is scarce a quartz miner in the state, who has beeu engaged for any leugth of time in the business who has not tried a great many experiments, and operated with different kinds of ma-chinery-differently arranged batteries, various kinds of amalgamators, pans, etc., etc. Now this experience made public, cannot fail to be of benefit to somebody. If it does nothing more it will serve to get up an increased interest in the busines*, and stimulate a spirit of enquiry and inven tion which cannot fail to be of great general benefit.

You, Mr. Editor, have frequently alluded to different kinds of machinery and processes, which have been devised, and have sometimes expressed your opiniun of them. But that is not altogether what we miners want. We want to know what those persons who are using that machinery think of it. We want the practical information, which can
only be derived from the mill or the mine-that's what we only be derived from the mill or the mine-that's what we waut. [Our correspondent is sensible and hits the nail
squarely ou the head, every time.-Ed. Press.]
I see by the last number of your paper which 1 have received, that you propose to give us some information, about prospecting, a knowledge of minerals, etc., and that you have commenced a series of articles under what jou call "the Miners' Laboratory," which you propose to continue. That is a kind of information which I think you can
pick up for us among your books and libraries, which may be valuable to as working miners and especially to prospectors. I shall read your articles very carelally, and, I trust, derive much informatiou from them. But $\pi$ hen it comes to talking abuut "processes," mining, machinery, etc., I think, with ail due allowance for your editorial judgment, that a little practical infurmation, from persons who are actually employing these processes and using the machinery describ_ ed, will be of more real service to us miners, than that class of information derived from any other source. [Our correspondent is right again.]
Another thing, Mr. Edrtor, we miners are generally pretty hard working men and can't afford either the money, or the time to take and read all the papers in California, to see what all the miners have to say about this business and experinnce. If we read our local paper and one other, say a commercial puper, from your city or state, and then take the Mining Press, it is about all we can manage. We want our local paper for its local news; we want a commercial
paper for general iutelligence, and we want the Mining paPER, as an indispeusable necessity to keep us posted and fully up to the times in all matters of mining interest. Now the habit which miniug correspondents have of sending their communications promiscuously to all the papers in the state, it appears to me, is "a very bad habit," and a very incouvepient one to those of us who desire to keep posted in such subjects; because, to do so, we must open a reading room, and file all the principal papers in the state, and sift out an immense amount of chaff to get a little wheat. Now as we have a mining paper, why cannot maners use it as a common medium of communication with each other? [Our correspondent puts a very sensible query.] But my letter is getting, I fear, quite too lengthy for your columns. I have a number of other suggestions which I would like to make, but for fear of wearying your readers, I will defer them till another time. Yours, truly,

Miner.
We hope to hear from "Miner" often. [Ed.

## HUMBOLDT CORRESPONDENCE.

Unionville, N. T. May 1, 1863.
Editor Mining and Seientific Press.- When I left San Fraucisco I promised to give you and the readers of your valuable paper an occasional letter from this section, and so far as I am able I will make my promise good. It has been so short a time since my return that you must be content with a very short and impartial account of the mining operations that are going on in this region. I find, upon my return, our mountains and valleys dressed in the benatiful robes of spring, our little village presenting a cheering aspect, and our miners, with cheerful and smiling countenances, with their sleeves rolled up and pitching into their ledges.

## progress of the mining operations.

The Peru Company, on the Peru ledge, are running a tunnel to open their claims. The tunnel is now in 45 feet. The Nevada company, on the same ledge, have their tunuel in upward of 100 feet and the work atill progressing. The Mars company are sinking a shaft on the end of their tannel. The shaft is now down over 60 feet, and they are taking out some very rich rock.
The Logan company, on the Manitowac, are sinking a shaft on their claims with fine prospects. The shaft is now run thirty feet deep. The Dubugne company on the same ledge are taking out some very rich rock for shipment to San Francisco. The Sargent company are putting their tunnel through as fast as possible. They are within fifteen feet of the ledge. The Cincinnatus tunnel is in seventy-five feetr, The Rising Sun tunael is in ono hundred and seventy-five feet. The Maine ledge has a shaft thirty-five feet deep. The ledge is four feet wide and nearly all of it very rich mineral The Alba Nueva tunnel is in two hundred and seventeen feet, with a shaft sixty feet deep at the end of the tunael. The National has a shaft eighty feet deep on their ledge. This company have about forty tons of ore at the will and about the same amount at their shaft. The Governor Downey has a shaft on their claims forty-eight feet. The Mary Bell tunnel is now in two hundred and eighty feet.
The Eagle tonnel is in over sixty feet. The shaft on the Lewis Cass is now down over sisty feet on the ledge. The Adams tunnel on the first north extension of the Mars ledge is in over one hundred feet. The Shasta company running for the Albd Nueva and the Governor Downey ledge have their tunnel in two hundred fect. The Delerio, Flora Temple, Brutus, Independence, Calitornia, Jackson, St. Louis, and Kingston ledges are all being opened either by tunnel or shaft.

The Bloomfield company on the Marblehead ledge have recently struck some very rich ore. 'The Hamelin company are going to commence their shaft in a few days. This ledge is over four feet wide and immensely rich. It is a recent discovery and the fortunate owners feel confident of realizing an immense fortune from their claims, and "Quartz" thinks that they will not be disappointed. A very rich ledge called the "Unknown" has recently been discovered by R. G. Ferguson who is a rery worthy and industrions old geutleman. The Schuylkill company are now sinking a shaft on their claims. This ledge is between five and six feet wide and some of the rock is immensely rich. I have seen speci-

Iangton © Co. are now stoekiner the road between this place and C'anson and Virgimiat C'ities for a tri-weokly linu uf stures. They have been ruming a werkly stare only, iluriner thes winter, but travel is inereasing so mpilly ou this rond. that we rhall soon reçuire a daily line, and Sims. Iangton and Capt. Ayor are just the men to keep up with tho wants of the country in tho stage and Lixpress line. Our town can now basast of a priating officu. The first number of the paper to be called the "Inombuthll Register" will he issuen tumorrow. Humboldt will now be able to speak for hersel! through the press.
Prosprctisa, etc.
Considerable nrospecting is now going on in the various mining districta, especiatly in Alabama and 'lable Mountain districts. These districts are situated on the range of mountains east of the llumboldt range. 'There is plenty of timber there which will be of great adventage in working the chaims. The Silver Cord is the name of a very rich ledge lucated in 'Juble Mountain district. The leage is over five fere wideeand assays over five hundred dullars per ton from tup rock. The Sulo ledge in Alatrama district is nnother rich fedge and assays very rich, but we are unable to give the firures. The Batavia, Oro-fino, Telagrae, Missouri and llumbur are all very rich and well dutined ledres. The owners of the last named Iouge are so thoroughly convinced that the ledge is immensely rich that they have no fears of its lusing its reputation on account of its name.

## mills wanted.

We need many more mills here and I wish some of the intelligeut capitalists of gour city could be induced to pay our country a visit and see for themselves.

As I mformed you in the begioning, this letter must neeexsitrily contain only a partial account of mining operations hure I have confined myeelf principally to Buena Vis'a district, for the reason that I have been unable to hear from the other districts since my return. In my next I will endeavor to give you an account of them. All of the districts are rich and your readers shall be informed of them occasionally by

Quartz.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the slate, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metuliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable tect. If in rock of any description thal rock pounded fine in a mortar and washed, in the same manner as alluvium, will usuully expose its gold to the naked cye, if there $1 s$ any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and kerping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.
Not 80 with othermetals. Silver, copper, zinc, niekel, and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and srientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. Alter reading deBcriptions, however, and corvefully exrmining the specimens described, the explurer may go out and search with some degree of coufidence and intelligence. A study of the characteristics of the sulphurot ares alone, would lead an explorer to pass over, entirely unoticed, the rehost varieties
of the ores known as Chlorides or Iforn Silver, which, from the fatily with whell they may lee wouket, ath their usinal
 ores. There is mach reatom to helieve that this varicty of silver ore will the extensively fund in all the rolcanic rions of this sitate. sio with many other ores.
Considering the great difficulty, in the present lack of cabinet collections, and other means of iustruction, to acquire a practical minerallogical ami geologieal exlucation in this State, and desirous to sid, to our fuilest cupncity, the development of our mineral resourees, wo herely make the offer to miners, prospectors and all others, who in their travels or explorations may come acruss specimens having the appearance of rarity or value, to carefu'ly examinu and pronounce upou the same, free of charge, as to their characteristics, value, etc., whenever any such specimens aro brought or sent to this oflice free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our atteation to any such requests which may be presented to us.
Our object is to furnish the miners of California with overy class of information which shall be valuable to them in the progress of their calling and in the developent of the mineral resources of the State, and we know of no way in which we can devote a portion of our time more to the interests of miners than in the mannor here proposed. The ouly equivalent wo ask is that they shall do what they reasonably can to sustain and improve the paper devoted exlusively to their interests.
In carrying out the plan we propose, every ininer and prospector should be at all times on the lookout for any new mineral. Tne ordinary rocks with which the miner mects in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a picce of quartz or rock of a quartzoze nature, which presents any uucommon anpearance in texture or color that has not been thus modifed by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place." and if the cause of its peculiarity is not ovident and readily seen, it should not be passed carelessly by. There may be valus in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come nuder the notic of the California prospector. These articles will be published under the head of "The Minen's Laboratory," and will be fuund of great value to the mining public. [Mining and Scientific Press, April 20.

Subscribe- - Are you a miner and not a subscriber to the Mining and Scientipic Press? If so, you are an annual loser of many times the price of a yenr's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a rolume of the Piesss, cannot he bought from the shelves of any bookstore in the country for the price of several year's subscription. Ilo you cher send a paper to the "Old Folks at Home?" If so, and you desire to send important infurmation and valuable reading matler, jou can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an aceount. of the real industry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their suluscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Prass for three mouths even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontue the paper after being a constant reador of it for even that short perioci.

THE MINERS＇I．ABORATORY．－NO．III．
We closed our chapter under this head for last week some－ what abruptly while discoursing upon the＂Peculiarities of Quartz Veins．＂We have stated that these veins are usually found in＂setts＂or clusters．California is no exception to this rule．The general direction of the older class of quartz veins in the auriferous districts on the western slope of the Sierru Nevada is north and south ；the east and west se－ ries of veins is nore recent and may be called secondary． Mr．Remond of this city，whe has paid much atteution to the geology of the quartz veins of this state，remarks that ＂the metalliferous character of the secondary quartz veins is wortby of note．They bear gold，often in a chrystalized form，which is very rarely the case in lodes running north and south．The numerous threads or minate veius crossing them contain much galena，in small leaf－shaped masses，and sometimes in cubic chrystals，with more or less silver．These lodes als？contain much white iron pyrites，with some arseni－ cal and copper pyrites．＂The following paragraph，which like the one above quoted，was written some two and a half years since，for $I$ Echo du Pacifique，and prophet cat the time，has since been fully veritied by actual discc⿱⿰㇒一十凵夬eries．
＂The combinations of these different metals suggests the possibility of the discovery of siiver mines．Some speci－ mens taken from the quartz mines of Soulsbyville，resemble the argentiferous ores of Washoe．At Washoe the silver is mixed with lead，iron，arsenic，copper and a little autimony， all the metals being in a condition of sulphurets．At Souls－ byville，the iron and lead predominate，and the other metals are in smaller quantities，with a total lack of antimony．＂
No other portion of the world has been so carefully studied with reference to its metalliferous formations as Cornwall and Wales，and it has been asserted with，much confidence，that a description of these veins would，general－ ly speakiug，suffice for those 0 every other portion of the globe．So far as their direction，length，depth，and dp are concerned，the assumption is donbtless quite correct，but with regard to their contents，we apprehend quite distinct－ ive characteristics will be noticed．No one who has ac－ quainted himself with the quartz veins on the two slopes of the Sierra，can have failed to notice most marked and distinct characteristics between the two．Other peculiari－ ties may be noticed between those and the veins which are found far out toward the interior of the＂Great Basin，＂and others still more marked when we reach the opposite rim of the Great Basin in the neighborhood of Pake＇s Peak，as will be seen from the followiug extract which we gave in our issue of April 20th，from a correspondent of the＇I＇erritorial Enterprise．
＂The Pike＇s Peak ores contain no quartz．They are iron pyrites，more or less mixed with copper pyrites，lead，anti－ mony，etc．＊＊＊On siuking upon this no veinstone what ever is tound．The vein is a simple crevice in the granite bed rock filled with pyrites．＂
In fact almost every vein has much that is peculiar to it－ self．Perhaps the most simple of metalliferous veins are those known as＂gold－baaring，＂and it is to those，almost exclucively，uutil within a short period，that the miners of Galifornia have chiefly paid attention．Until after the won－ derful developments of the Comtsock lead in Washoe，not one prospector in fifty in California ever thought of exam－ ining a vein for uay other＇mineral than gold，which is alwost always found pure and free，and consequently readily known to the most unpracticed explorer．Hundreds of veius，in California，now known to be of the highest valne in silver and copper，were，in the early days of our mining experi ence，passed by as worthless，simply because they did not ＂show gold＂in working quantities．

Very few of our readers are ignorant of the ordinary in－ dicatious by which the probable presence of quartz veins is noticed，or the manner usually employed in discovering theirlocality，or tracing their direction whenever found； hence we will not weary their patience by giving details so generally known．

In examining into the phenemena of quartz veins on the Pacific Slope，it should be borne in mind that but limitod time bas elapsed s nce the first．efforts of mining were undertaken here．On the eastern contivent and espec－ jally in Commall and Waken，mines have heon woncht from time immemurial，and yet scarcely a year passes without
adding some new fact to the great mass of information al－ ready stored up，by the generatious who have lived and died in studying the theory of these mines，the details of their structure，the relution of those veins to the various ores which they contain，and to the enclosing rocks，etc．，etc．
Many of our citizens complain of the apparent dilatori－ ness of our State Geological Survey，from the fact that our miners are not already put in possession of facts for which English miners have patiently waited whole decades，and for which the English Government has paid an hundred fold more，than our Commission has yet asked for．Such persons cannot be aware of the difficulties and labors at tendant upon the solution of the various problems present－ ed in the investigation of so complex a subject as the study of such a wide and varied mining field as is found near and within the boondaries of the State of California．

## the grology of copper．

The recent discovery of numerous and valuable veins of copper，throughout，pretty much the entire levgth of the ：tate，and the consequent especial degree of attention which is now being drawn to this new interest，has induced us to vary，to a certain extent，what would otherwise have been a natural procession of subjects，in such a series of chap－ ters as we have commenced．And in accordance with un－ $m$ rous requests to that end，we shall＂interpolate＂whater－ er number of chapters，may be required to place before our readers all attainable inforriation on the subject of copper． which can be of any practical value to prospectors after，or workers in that mineral．In doing this we shall have occasion to repeat，to a certain extent，the material points of some paragraphs wrich have already appeared in previous num－ hers of the Priess．
In referring to the geological conditions under which cop－ per is found，we shall commence with Cornwall，a district which furnishes nearly one half of all the tin and copper produced on the globe．The rock in which the copper bear－ ing ores of this region are found is principally clay slate，or killas，as it is there termed．The country，however is much broken up and diversified by obtrusive granites and elvans， which have been protruded through slates by igneous agen－ ces from below．The general direction of the copper veins is east and west，and nearly at right angles with the tin lodes．The ores of copper and tin are seldom found in the same vein in Cornwall，and neither metal is often found in very great abundance at a le－s depth tuan 80 or 100 feet be－ low the surface．Some copper veins in this district have been traced several miles－in one instance seven，without any evidence of discontinuance even at that point．No per son has ever yet seen the bottom of a vein of either tin or copper．The ores found there are usualiy the yellow sul－ phuret of copper and iron，with which are associated at times，black，and gray sulphuret，red oxide，and native cop per．The general average of there veins is about $21 / 2$ per cent．，but which by dressing is actually brought to about eight per cent．before smelting．
A nover，Letter Carrier．－A curious project has been set on foot for the speedy conveyance of letters between England and France．It is proposed to erect in b．th countries，at a distance of about 10,000 metres from the coasts of Calas aud Iover，a strong edifice of masoury，coutaining a stean eugine of sufficient power，by means of which an inmense wheel， 25 metres in diameter，is made to turn furty times a minute．
By this rotation a seres of wires，forming a gigantic strap extending across the channel，is coiled around the wheel at， one end，say at Dover，and uncoiled at the other，Calais，and conversely．To this strap indib－rubber leather bags are to be attached，which are thus conveyed across the channel at 3,000 metres per minute，su that，within the space of twelve minutes the letters and despatches from one county may be landed in the other．
A Contrast．－How rich the following paragraph appears which was originally printed in the English Quarterly Re． view，in March 1825：
＂We are not advocates of visionary projects that interfere with useful establishmeut．We scont the idea of a railroad as impracticable． ing twice as fast az stage caches．We should as soon expect the people of Woolwich to sufler themselves to be fired of

## THE MINING STOCK MARKET．

The Stock Market both in San Francisco and Virginia has been unusually depressed during the past week，with re－ stricted operations，even in approved shares．Several cars－ es have led to this depression，neither of which proceed，at all，from any lack of confidence in the mines themselves． Speculative operations have not been noticod，in part，for the reason tbat no new developments have occurred，on which operations in this line conld be based．The unasual excitement with regard to eastern intelligence absorbed much attention that would otherwise bave been expended in ＂feet＂speculations；but probably the chief cause of the de－ pression of the week may be attributed to the unnsual strin－ gency of the money market，which has operated，in some in－ stances，so as to seriously interfere with time opera－ tors in meeting their engagements．The demand for money for stoct operations has been exceedingly urgent，as high as 4 and 5 per cent having been offered ou se－ curities of substantial market value．
The present check upon operations in the mining market， is an encouraging indication，rather than otherwise，since it cannot fait to exert a healthy influence upou the legitimate business of mining，by reason of the effect it will have to discourage speculative actions，and，so to some exteut，en－ courage a more rational investment of capital，where it will increase material values．The flow of eapital into the inte rior as material aid for the development of the mines，is daily increasing，and to its tendency in tbat direction，may be attribated，in no small degree，its lack for speculative op－ erations upon Montgomery Street．The signs of the times indicate a growing conviction，that the business of swapping jackets is pretty much＂played out，＂and that the folly of speculation is fast passing away and giving place to the nore legitimate idea of a permanent development of the mines． The covelusion is now pretty much universal that the mines are not only rich but perwanent，and that a sufficiency of the precious metals may be obtained therefrom by ordinary expenditure and industry，to satisfy any reasonable desires of gain ；and that the most rational way of acquiring a for－ tune is to be content with ordinary risks and reasonable time，rather than to take the chances of precarious specula－ tion，with the hope of winuing a competency in a day or week．

We bear very favorable accounts from the mines of this region．A large amount of machinery will soun be put in operation there．A party of capitalists in this city who have recently sent agents into that region have become so well convinced of its mineral value that they are about to com－ mence operations on a liberal scale，and have already sent duwn a party of working men，with machinery，etc．，from ： which we confidently predict early and satisfactory results． That much gold exists in that section may be surmised from the following transaction which occured there in the winter of＇60 and＇61．
A large amount of snow had fallen and a most severe winter was evidently upon then，with a pretty fair prospecto of a cessation of mining operations until spring．But with the knowledge that the gold was there，it was resolved that Yankee ingenuity and energy could gather it up io spite of wiad or weather．＇The miners went to work aud construct－ ed large sheet－iron tanks，filled them with snow theo melted it and with the small quantity of water thus produced，added to the small natural flows，in some instances washed out as high as \＄16 per day！Thus the element which is generally considered as a pretty effectual extinguisher of placer min－ ing operations was made to furnish in greater abundance the very facilities needed for gold working！The gold of this region is of a very superior fineness－assaying as high as \＄19 per ounce．We trust the expectations of even the most sanguine，with regard to this region may be fully realized．
Incombustible Dresses．－In the Lonbon Polytechnic Insti tution，Professor Pepper has latelyexhibited in a most original and practical manner the relative combasibility of muslin dresses prepared with certain chemicals and drasses not 80 prepared．He brourht forward a lay－figure，attired like a lady largely be－crinolised．A light applied to the skirt of
the dress soos caused the figure to be lost in a pyramid of： the dress soon caused the figure to be lost in a pyramid o of flame，and some of the roore susceptable of the spectators sbrieked aloud at the frightful representacion of a too fequent reality．For the second effect＇a real lady，attired in garments rendered incombustible by prepared starch，walked up and down between two troughs in which naptha，furiously flaming phayed upon her skirt nuscathed．The starch with which thi played apon her skirt maseathed．The starel with which the

## WASHOE STOCK REMARKS,

Fur theweek endiog May 16, 1863.
Tho Stock Sarket at firg inla City dirgog the past week, bas been unu:
 fintil a welopmethes at the thines to cacte atheetion, and benee the usual
 mand. Thero lias henth mme litto elaquiry for Yellow Jacket and Priveoss at fi川ld HIll, at a slight nalvance.
Wir whfer uur riaters is the "tislex at the Virglnia stock Doards," and to our resular Virginia dity btock liint. Thu lattor moro aceuratsly roprenente the markie retes at Virgina, and is currected up to Friday precuding our
day of publicablon.

There has been less activity in stocks duriug the present than the wock previous. This fact is probably moro attrobutable to the over excitemeat in relation to the war news than any want of confidence in the mines. The developments made would seem rather to olicit greater activity than do liue iu the market.
There Las been a klight decline in Belcher, owing to there haviag been an assesment of sles per font levied on the stocks, preparatory to the prosecution of a certain sult with the Koh-i nuor.

## ESMEREADA STOCHE LIST.

## REMARKS

A large amount of business has been done during the past ten days in Esmeralda District in the purchase atd sulo of mining stocks. The advancu in srevertl claims the past few days has been caused by actual develomments of a rich character.
Mining of asubstantal character is being prosecuted with vigor and there ns nuw umor work being done mon the varions lodges in this Distriet than at auy ficriud sues the discuyery of the mines.

## WHEELER'S

Amalgamating and Separating Pans.
It is acknowledged by all who have examined the prineiples and wituessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.
The most important principle councted with the opeprocess from thit of extractiag the amalgan from thic pand. The chier cause of toss of the prectous metuls urises from the passing off of the samo in combination with the quicksilver, during the pruces of trituration, aud in cleaming up. By che introductiou of the separating Pau
to follow the trituration this loss is entirely aroided. In workiug these muchines stere is Do appreciable loss quicksilver, und hence rone of the precivus metals. Where thess pans have been introduced and operated by the side of others on sands frow the same vit, the

SPECIAL NOTRCE.
Wo wish it distinetly understond that all the interest hich Julius Silveramith ever had in the Mining and Scienfre I'mss, ceased in Nuvember of 1862. Ewer \& Smita e now the publishers and proprietors.
he copper mines of calaveras county-inTERESTING LETTER.

Copperopolis, Cat.., May 20, 1863.
Mr. Edrtor :-I propose giving a few items from the Coper Mines of Calaveras County, which may interest those your readers who have faith in this class of mines being rade productive in California. There are many Californins who think that mines of copper can possess no value unFss the ores are fornd in concentrated lodes. If the people this State would only devote a little time to reading the port of the English copper mines, they would soon find at that concentrated lodes of copper ore are very rarely und, and that copper lodes do not produce one third cop or ore.
The principal copper mines that I have visited in this punty are the Union, Keystone and Calaveras at Copperop is, and the Napoleon of the Gopher district. Not yet havg bad time to visit other mines in those localities, I can ot speak of their real worth, but report says there are quite number of good prospects in the vicinity of the mines entioned above.

## the union mine.

This mine is not surpassed in richness by any other copor mine in the world, as far as developed. The Company ave developed their mine about 600 feet in length, and ave three working shafts, 180 feet deep, and an engine up Heach one. The lode varies in thickness, as all lodes do, om one to twelve feet, and will produce about 10 tons of per cent. ores to the fathom ( 6 feet square). Two ousand tons of this class of ores could be easily taken om the mines monthly, by 100 miners; and this indepenpat of a large quantity of 6 per cent. ores, which are mixed ith slate, mundic and sulphurets of iron. These poorer es can egsily be concentrated up to 18 and 20 per cent. ee, the sale of which ought to pay all the working expenss of the mine. This company have now on the surface p,000 tons of 7 per cent. ore, ready for concentrating, Id have not yet stoped a foot of ground. The galleries on which this mass of mineral has been taken comprise a mear extent of 600 feet. Persons acquaisted with mining perations can readily calculate the number of tons of ore hus diveovered and proved. I believe 300 tons of ore is pout the smount of their present monthly shipments, hich is loss than their waste ores could be made to proıе.

## THE KEySTONE MiNE.

This mine joins the Union on the East. The Company as a very fine lode, which can be easily traced the whole ngth of their claim.- 3300 feet. They have two working rafts ; one 260 feet deep and the other 140, located upon
each end of the mine. The lode in these shafts looks well. At the depth of 260 feet they havea fine lode of concencent. as it form the mine. The was that has done ty, has cost double what it ought to have been dune for, in and of undoubted richness. A drilt has now been run 78 consequence of the employment of inexperienced superin. feet upon this lode, and shipments of 20 per cent. cupper tendents ; consequently the company has not yet puid any are now being regularly forwarded to your city for transfer dividend. The mine has been worked entirely for lodes of East. The Company has a large quantity of 5 and 8 per concentrated ores, such as the Union mine produces. Such cent. ore on the surface, which will soon be concentrated. deposits are few and far between in this, as well as in most other mines the world over.

The expense of ruoning drifts and sinking shafts to find deposits of concentrated ores has kept this company back from ranking with first class copper mines. The company has recently, however, made arrangements with a practical copper miner to take charge of their mine and erect "Concentratiog Works." This party has had 30 years experience, as Superintendent of copper mines, and a concentrator of copper ore. We are quite confident that this mine, inside
of four months, will be shipping from 400 to 500 tons of 20 per cent. ore per month. The new Superintendent will send to the surface the entire bolk of the lode, as it runs, and select the No. 1. Numbers 2 and 3 will go to the concentrating works and subsequently be returned as No. 1 ore. Thus every particle of copper ore will be saved and prepared for the market. Such a method of working will soon make the Keystone equal to the Ophir, of Washoe, in its yield of wealth.
Parties are now in your city negociating for machinery, by which to concentrate ores and this Company will no doubt have in operation the first copper concentrating works on this coast. The mill will be in operation, probably, within four months.

## the calaveras company.

The mine of this Company-the 2nd western extension of the Union-bas not yet been opened to any great depth 'Hhis Company has done nost of its work upon the croppings of the lode ; they find a superior quality of mineral such as the black, gray and "horse flesh" ore-the latter a local term for the red oxide of copper. Thesie ores are chiefly found on the back of the lode, never in large quanti ties, and not often deep down. They are good indications in a mine. The Company is shipping some ore, but not enough as yet, to pay expenses; neither will they do so for some time to come, unless they change their present mode of working.

## the napoleon mine.

This mine has never been properly worked until quite recently. Until within a few weeks all the work has been done upon stringers"and feeders, the main lode not having been struck until since the present Superintendent has had charge of the mine. Since the change in its management, the working plan has been so modified as to make it essentially a new mine. The main shaft is now 140 feet deep. The main lode or rather its foot wall, was struck in this shaft by the former Superiutendent, but he was not aware of $1 t$, but passed on by it,timbering as he went down, and
comusenced work upon some feeders, which were lying undes the main lode. When the new Superintendent took strike the lode which his predecessor had neglected, and was rewarded by finding a well developed vein six feet thick, and of undoubted richness. A drift has now been run 78 The Superintendent of this mine, who also has charge of the. Kevstone, informed me that he should be able to ship from 100 to 150 tons of ore per month, as soon as he had his drifts properly opened and in good order for working; which would be in a few months.

## conclusion.

From the above notes, which have been hastily thrown together, your readers may be able to form a pretty correct judgment of the value of our copper mines in this section. Persons interested, and especially those working and superintending copper mines should bear in mind that it is not necessary that theyshould have lodes of concentrated, 20 per cent. ore, to make their mines pay. Give me a lode four feet thick, with the mass of vein stone averaging 6 per cent. of copper-I care not how much scattered it is thro' that mass-and I will gaarantee to you dividends equal to the best paying silver mines in Washoe.

Copper Miner.
Laborers Wanted.-From every part of the mining regions we hear complaints with regard to the lack of laboring hands. The unusual exodus of miners over the mountains, and the increasing interest which is being taken in copper mining on this side, appears to have completely absorbed the surplus labor-or at least all that is skilled in underground work. Wages, we understand, have materially advanced in many places, and it is found necessary to offer additional inducements, to keep men at steady employment, in preference to joining in the general rush for "prospecting" on their own account. In Del Norte county, we understand some of the mines are at a stand still for the lack of hands to work them. There is great complaint also of the scarcity of laborers in the Copper Mines of Contra Costa couniy, while gentlemen recently from the central and lower portions of Nevada county inform us that mining employers there have been compelled to make material advances in the wages of their hands to keep them from joining in the general rush for "new diggings." We hear similar reports from other sections. The present promises to be one of the most successful mining seasons on record. Large shipments of copper ore will saon begin to arrive in this city, and we are greatly deceived in present indications if this new branch of business, depes not reach an important position in California industry, ere the present year is passed. There are huadreds of idle men about this city complaining that they have nothing to do, who might find good employment, at this time, in the mountains, and be of service both to themselves and the State in opening up the new arenues of wealth the existence of which their

OUR MECHANICAL INDUSTRY.
MIners' Foundry and Machine Works
We visiled this establishment a few days since and took a hasty survey of the premises. The increasing importance of the mechanical interests of this city may be very correctly estimated by the extensions of the working area of our various foundries and machine shops, wnd the evidences of this kind which we met at the Miners' Foundry, testify that this establishmeut is enjoying its full share of this increase. Large additions have been made to every portion of their working room and eveything about the establishment has the appearance of order, convenience and thrift,

In addition to the usual mechanical appliances this foundry has been converted into a perfect Miners' Museum. Here may be seen almost every description of machinery employed for mining purposes not only in the various stages of manufacture and in completeness, but also in actual practical operation. We saw at work Wheeler's Amalgamator and Separator, Howland's New Freyberg Process (anew and valuable invention which we shall notice more fully next week.) West's Amalgamating Pan, Celeman's Pan, and four or five different Crushing and Grinding Machines, for working quartz, Mineral Paints, etc.
Fully alive to the great importance of the Mining interest the Proprietors of this Foundry have set apart commodious rooms for the especial use, and provided ample notive power for the working of their machinery, both to eaable the inventors to exhibit practical tests of their several inventions and improvements, and also to afford miners and mine investors every convenience for testing their ores upon a practical scale here in the city.

Upward of 100 hands are employed in this Establishment. It has two furnaces capable of melting seven and a half tuns of iron each. Single castings bave been turned out at this Foundry, weiging six and a half tuns. They are now constracting for the Real del Monte Company, at Aurora, a beam Engine of 100 horse-power. This Foundry also has the contract for the entire construction of the Mill for this Company. We examined the plan and drawings of the same which is to cost about $\$ 100,000$, and which will be one of the finest works of the kind on the Pacific Coast. The Mill will be 160 feet long by 60 wide, with a brick smoke stack 70 feet high.

This Foundry has also recently constructed and put in operation the Wide West Co's new Mill. They have also lately shipped the machinery for S. C. Fogus \& Co's Mill, which is now in progress of construction, as a custom mill at Aurora. This is a 12 -stamp steam mill, and will use 8 Wheeler Pans and 3 Separators.

They are also at work upon a mammoth amalgamating pan of West's Patent, which is 24 feet in diameter.
We bave received a copy of the annual circular of this firm, containing their advertisement, illustrations of various machinery manufactured at their establishment, and a large number of valuable mechanical tables, rules for mensuration, etc.

We shall endeavor to look in upon some other establishments and take a few notes in scason for our next ssue.

## Copper Ore-The California, Smelting Works.

The Secretary of the California Smelting Works, gives the following schedule of prices which the Company will pay for copper ores delivered at their wharf at Antioch :-
$71 / 2$ to 8 per cent...

9 per cent..
10 per cent.
112 per cent.
and in the same ratio for ores of higher assay. The ore is estimated by the usual smelting tun of $2,3761 / 2 \mathrm{lbs}$. dry weight

When desired the Compary will advance all expenses of freight and transportation from the Mine to the Works. The ore may be sentin bult or in bags, which will be returned. Payment will be made in gold as soon as the value of the ores is ascertained by the assay of the Metallurgical Chemist of the Company.

As architect proposes to build a Bachelors' Hall, which will differ from most houses, in having no eaves.

Notes of a Trip to Slate Range via, Los Angeles, Telacapa and El Paso.
[We give below the first of a series of letters which will be furs shed by an intelligent correspondent, who left this city some two months since, for an exploring expedition through, the Slate Range Miniug District. The notes of travel, given in the present letter, will be interestiag to parties who may think of visiting that region, and the subsequent letters, descriptive of the mines, etc., will, no doubt, be found truthful and vuluable.]

## the departure.

Saturday, March 28, 1863. Having bid farewell to our wives, children, sweelhearts, and friends in Alameda and Oakland, our party, consisting o. two strong limbed and strong hearted young men and myself, crossed over to the city, made up our final purchases of such articles as we supposed the trip required, limited to some extent by the scarcity of coin, sent them on board the steamer, spent the evening with some friends, took our last sleep in San Francisco, for one or two years to come, perhaps, and on Sunday murning at 9 o'clock stepped on board the fine steamer Pacific which took the place of the disabled Senator, and in fifteen minutes her loud mouthed bull dog belched forth his parting compliments to the just awakened denizens of the Golden City, and we were fuirly started on our long journey to the far distant silver mountains of San Bernardino county.

## the thip down the coast.

But few incidents occurred upon our trip down the coast. The weather was very fine, but after passing the Gave the steady regular swell of old Ocean's bosom, caused a curious seusation about the gastric region, which prevented us from appropriating our rations for the balance of the day and even made a demand apon us for our breakfast. Determined to become acquainted with coarse fare and limited accommodations as soon as convenient, at night we took our blankets and made our way to the sleeping apartments devoted to the forward passengers. These we found commodious, each with a good clean matrass, and the only drawback was the fixidness of the ball eyes which should have afforded us some ventilation. On appealing to the steward, he informed us that the orders were peremtory in regard to that matter, and 1 suspect they were given while the steamer was engaged in a higher lattitude and had not been revoled.
On the following morning, our appetite having returned, we obeyed the call to breakfast, but were somewhat checked on fiading the table nearly surroundel with Chinamen, outnumbering the white folks considerably. Some of our party gave unmistakable evidence of their diggust at this arrangement, in plain English, but the writer said nothing, as the Johns were as cleanly in their dress and manners as any at the table, and determined to put up with anything within human enduranee, rather than find fault. But the fare was really execrable and by those present who had traveled on the senator, was said to be very far inferior to hers. We made out to reduce a little of the very tough fried beef, hard bread and molasses, and sweetened colfee, and then resorted to our own grub box for a nice soda biscuit and a ginger suap to finish our meal, with a cup of good water of which there was plenty on board.
Late in the evening of the second day out, as we were promenading the upper deck, a young man approached us with a book in his hand, accompanied by another holding a lanteru, and asked for our fare ( $\$ 15$ ) which we paid; but somo poor fellows who were duzing in some of the obscure corners of the vessel, missed, I am quite positive, the kind attentions of these gentlemsn. Good enough for them. They should be around on such an important occasion. Oue of our passengers who had been in Uncle Sam's employment as a teamster, was there, on his way to join a portion of the Army on Owens' River, if I remember rightly, had only green backs on hand. He offered three fives for his fare, but they would not take less than four. He refused to give more than three, and was told they must take his sack of clothing, "All right," said he, "and perhaps you had better take my blankets also." "Yes, we will." Said he, "I can get them again when we arrive at San Pedro." Poor fellow I He did not succeed ; but waited till the steamer returned from San Diago, then went on board, paid his full fair in coin and took his baggage. He found it too
big a jub to resort to law, against the Company, though he nijght eveutually succeed, perhaps.
'I'vesday, 3lst. Arrived at anchorage in the Bay of San Pedro, at 4 A. m., at a little outside Deadman's Island, and soon found ourselves surrounded with yawls and barges to convey passengers and freight to 'Tomlinson's Lavding, ()ld 'lown, and a pretty little steamer belonging to Col. Bauning to take those who preferred to New San Pedro.

## on shore-old and new san fedro.

We being acquainted with Mr. Tomlinson's reputation for urbanity and kinduess to strangers, took passage in his boat and found all we had heard verified. We stayed with him till next morning, enjoying the leisure hours in helping him and his men to uncad and stow away freight, and between the trips he would recount some of his adventures with Indians and bears while teaming in different parts of this State, Oregon and Mexico. He, I think, is the bell teamster of California, having for many years, the greatest a mount of stock on the road His horses and mules are continually running on the roads with freight from his ware houses in Old Town and Los Angeles to the Colorado, Slate Range, El Paso, Owen's River, Coso, Anrora and eva erywhere else, with machinery and the necessaries of life for those who toil among the unlimited mining districts of our State and Nevada.
Old Sau Pedro is a small village consisting of Mr. 'Y's warehouse, his boarding-house and a grocery kept by a Gesman, close by.
New San Pedro appears to be a very pretty village, pleasantly situated at the head of the Bay, about $21 / 2$ miles from Old 'Town ; approachable with boats only at certain stagea of the tide. The indomitable energy of Col. Banniug and his associates will no doubt continue to make it the town on the Bay.
Camp Deuver is located there which adds much to the life of the place.

Whdnesday Morning, April 1st. Packed our freight on mule teams and at 10 A . m. started on foot for Pueblo do Los Angeles (the city of the angels.) On leaving the beach we ascended a high, sharp bluff and at once the eye took in the whule vast plain to the mountains about tweaty-five miles distant, with the city at the base and which would be visible from a slight elevation. This plain at this time pren sents the appearance of a great desert, not a tree or shrub, but occasional patches of a weed which in our younger days we called cheese plant, and which stock do not seem to relish, even when their supply of grass and clover is exhausted thus early in the season. Stock of all kinds is now beiag driven back to the valleys and gulches in the mountains to avoid starvation. It is expected that the losses will be very great, on account of the suall supply of water which fell last winter.
On this dreary walk we came upon a Rodeo in full operation and had a good opportunity for the first time to witness the manipulation of the hombres, on this annual ociar sion, in lassooing, throwing, branding the yoang stock and hunting off each man's animals by themselves so that he may; take an account of stock, make out his invoice and take his phace in the property scale to which he is entitled.

By actual observation we became convinced of the oft repeated assertion that ground squirrels, owles, and snakes live together in harmony. Large squirrels were moving ahead of us in all directions, about twenty yards distant and sometimes 100 would be coynted in sight. We saw the owls sit. ting by the squirrels holes and disappear as we appronched and suakes would occasionally follow them and lizzards anc horned toads (of which we saw some beautiful specimens, all seemed to have their homes with the snakes.

Arrived in Los Angeles in the evening and camped in the spacious storage yards of Tomlinson \& Co., oceupying, 1 fifty vara lot enclosed with an adobe wall seven feet high the front filled with adobe honses and offices, one side al ranged with stalls for horses and males, the other piled wit lumber kept for sale, and the centre filled with their gres wagons and stages.
We here enjoyed our first experience in sleeping in th open air, and it was not a pleasant sensation, but we soo became accustomed to it as the novelty wore off.
Finding no teams loading lor Slate Range: we amuse ourselves in looking about town and wandering into it

## MINING AND SCIENTIFIC PRESS.

country among the rincegardo for which this phace is justly famosas. Ilenty of urange cichards were tu le seall hat nu fruit. The sincyards presented as very trad afperathice, the stent though from ten tu twenty gears ohd being only about three feet high, consisting of two or three branches and euch braneh having only one spur or bud upon it. 'the leaves were starting out on sume of them, but the grass and weeds between the rows had not yet been distubed and torether with the acraggy stumps presented a desulate appearance. The arrangemente for irrigation about the city ure very fone, the I os Angeles River being conducted in small chanonels, so that all can have the use of it by turns, twice during the season I believe being the general rule. The streets of las Angeles gonorally present a someweat lively aspect, particularly aroum the pri cipul hotal, Belle Union and where the heaviest dealers in merchandive are locat d. A few fine brick blucks are up and well filled in with goods, and the market house with its fine turret elock and the court house, tend to give it an American appearance; but the many luw adobe dwellings, with their henvy walls and no winduws or an occasional upening eheckered with iron bars, tells plain'y that the old sjuabish ingredient still occupies a prominentoplace in socicty.
I remained in Los Angeles orer a week and such a dull Freek never fell to my lot before. Once the mail arrived from Nan F'rancisco and that was a great relief, though it required only a few minutes to appropriate all the Daily Alta servel up-which was the ouly paper I saw. On all occasions in Los Angeles when we replied to the question "What mines are you bound for?" "Slate Range," the enquirer would open his eyes with wonder and exclain, "I thought Slato Range was 'played out'! Why dou't you go to Soledad, Colorado, or El Parso ?" But Slate Rauge was our goal and there we would go.

On Tuesday, 7th, we found an ox team would start for Slate Range the next day, under the charge of McGuffs, and loaded with corn, lumber tools and supplies for the Fernando Mill Company. So we offered our services to Mr. Meguffy, as ox-drivers, or bull punchers, as they usually call themselves. He accepted one at low wages and would take our freight at 8 cents a pound, making no charge for personal baggage and blankets, and we could ride when we chose, on easy grade. So we closed and started out Wednesday morning, April 8th, at 10 o'clock, and walked 6 miles to Mr. Mayhew's ranch where the cattle were to remain over night to fill themselves before commencing the journey over the dreary deserts and mountains before them.

Mr. Mayhew invited us in, and we passed a pleasant hour with him. He is a candid Alabama Southern sympathiser and feels somewhat annoyed at the prospect of being drafted to fight in the northern ranks. Thinks that a regiment such as he would make poor defenders of the North. I agree with him fully. Yours \&c.
U. W. G.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which have of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metaliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discernable to the naked eye. An examination of any rock or earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable test. If in rock of any description; thal rock pounded fine in a mortar and washed, in the same manner as alluvium, will usually expose its gold to the naked eye, if there $1 s$ any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presence of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen hy the naked eye.

Nol so with othermetals. Silver, copper, zinc, niekel,
and many others appear in such a great variety of metullifrouls iurms as frenerally to defy all but the most practical and seientific cye. No description of these ores can bo written which will alford any very impurtant aid to the inexperienced in making explorations. A!ter reading descriptions, howover, and carefully extumining the specimens described, the explorer may go out and search with some degree of coufidence and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, ontirely unuoticed, the nchest varieties of the ores known as Chlurides or Horn Silver, which, from the facility with which they may be worked, and their usual richness, are generully considered the most valuablo of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic reriuns of this State. So with many other ores.
Considering the great difficulty, in the present lack of cabinet collectio's, and other means of instruction, to acquire a practical minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we bereby make the offer to m:ners, prospectors and all others, who in their travels or explorations miy come acruss specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whevever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.
In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new miveral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance io conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzoze nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or npar a vein of quartz it should be carefully examined "in place." and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notic of the California prospector. These articles will be published under the head of "The Miner's Laboratory," and will be found of great value to the mining public. [Mining and Scientific Press, April 20.

Subscribe.-Are you a miner and not a subscriber to the Minting and Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, partieularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contaiued in a volume of the Press, cannot be bought from the shelves of any bookstore in the conntry for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable readiug matter, jou can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an acgount of the real industry of the country as the Mining and Scientritic Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the onfy mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we rill, for the present, send the Press for three months even, on the recelpt of one dellar, in coin or stamps. It is our belief that no one will wish to discontne the paper after being a constant readar of it for even that short perioo.

THE ONLT MINING, MECHANICL AND SCIENTIFIC PAPER ON THIS CONTINENT.
THIRD YEAR: VOLUME YI-NEW SERIES:
A uew volume of this extonsively circulated papor commoncen Sept. 11,
862. It is intended that every number shall be 1862. It is intended that every number shall bo replete with infurmation concorning Mining, Scientific, Mechanical and mdustrial pursuits, together
will several original engravings, of new inventions, etc., prepared expressly for its columns.
This paper is devoted to the above purposen, together with the interesta Sfience, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader : aud it is the jutention of the proprio tor to spinc no pains or expense in making it equal in interest and valuable

The Mining Interest !
Will find it of grat value, as it will contain all the news appertaining to Nining, the prices and sales of Sining Stocks, new inventions of Machinery duaped to tiat purpose, and of everything generally that may be of service to the Miner.

## The Inventor I

Win find it an excellent medrum for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of rcceiving any information that may be necesary in obtaining his patent, the propies at Washingtom that exable bim to ob ain Patents witli dispatch.

## The Mechanic and Manufacturer!

Will be greatly benefitted hy its prrusal, as each number will contan sera eral original engravings of new machines and inventions, together widy $y$ large araount of reading matter eppertaining thereto. We are conslantle shall continue to extract whatever may be of benefit or interest to oureaders.
To Chemists, Arohitects, Millwrights and Farmers ! Tfis journal will be invaluable. All new discoveries in Chemisiry will he given, and a large amount of information of great service to Archnects and
Sillw wights will bo found in our columus. The Farmers and Plantens will mot be neglectel, engravings will be giren of agrieultural inplements, and the farming interest generally will beamply discussed.

## Terms. <br> To mall subscribers:-Four Dollars per annum <br> Club Fates <br> Five Copios for Six Monthe, 88, Ten Copies for Six Months, i6. <br> Ten Copies for Six Months, $\$ 16$. Ten Copies for Twelve Moutls, $\$ 30$. Fifteen Copies fre Twelve Montlos, $\$ 4$ <br> 

For all clubs of Twenty and over, the yearly subscrintion is only $\$ 280$ For all clubs of wenty and over, the yearly subscrintion is only $\$ 2$ so
Names cau liferent times and from different Post-ofices
Specimen copies will be sent gratis to any part of the country.

THE MINERS' T.ABORATORY,-NO. IV.

## TEE GEOLOGY OF COPPER.

Frange affords but one workable mine of Copper. Numerons mines have been wrought at various periods in the past, but, we believe, with the above exception, they have all been abandoned. The copper veins of this country are everywhere found associated with aluminous slates, more or less metamorphic, and among which, at frequent iutervals porphyritic rocks have been protruded. The mines at Chessy are directly at the line of junction of the granite and lias, (the latter a species of limestone.)

Germany.-The Copper Mines of the Hartz mountains occur in grauwacke slate into which numerous belts of trappcan rocks have been obtruded. The mines of Rheinbreiteubach are in the same character of formation, and are productive in pyritous and variegated copper.

Spain.-The general character of the deposity of this metal in Spain, is similar to those of the Hartz mountains.
In the Province of Hueloa is a district of much mineral wealth, the fermation of which is clay-slate, traversed by numerous porphyritic eruptions, and it is near the line of contact of the slates and porphyry that nearly all the metaliferous veins occur-the most valuable being directly between the two formations, having a wall of schistose slate on one side and porphyritic granite on the other ; the former usually composing the south wall and the latter the north wall of the veins. The veins are often found with both walls of porphyry, and sometimes, though unfrequently, with both of slate.

Prussia.-In the vicintty of Mansfield, in Prussia, an interesting deposit occurs, known as the "Keepferscheifer," or copper slate-a thin layer of which occurs in magnesian lime stone. Throughout the entire body of this "copper slate" is disseminated gray argentiferous copper ore.

Near Schemnitz, in Hur gary, is an interesting metalliferous region, which produces about 5,000 tuns of copper annually. The veins of this district are found altogether in porphyritic rocks, connected with sienites and passing into granites. The predomina ing vein rock is quartz and sulphate of barryta. The ores are pyritous and gray copper.
Norfay and Jiweeden.--The veids of these countries are almost exclusively confined to the gneiss and mica slate, more or less metamorphic from subterranean heat. The cupper from this region is highly esteemed in consequence of its purity and freedom from arsenic and other metals.
Russia. - The copper deposits of Russia, in the Ural Mountains, are also remarkable for the purity and richness of their ores. The copper ores of this region are found chiefly in thin veins and nests of malachite, which lies in a broken, unconsolidated mass of detritus, overlying the surface of the uptarned edyes of lime-stone strata, intermixed or rather intercallated with ridges or ledges of trappean rocks. This malachite, though not in immediate contact with trappean rocks doubtless owes its origin, indirectly to igneous action, being probably a secondary product resulting from copriferous sublimation, accompanied by stalag mite deposition.

Cuba.-The copper deposits of Caba, like those in the Ural Mountain region, are not in regular veins, but in beds and masses, in immediate conbection with igneous rocks, such as greenstone and serpentine. The gangue of these deposits is composed of quartz, and common white marble The ore consists chiefly of yellow sulphurets, although blue carbonate of copper is not uncommon.
Chur.- The copper mines of this country are very numerous and of great value. They exist chiefly in metamorphic granite, with veinstone of quartz aud jasper.

In Australia the mines of copper are situated in an association of rocks quite similar to those formed in the Cornwall copper districts. The Barrossa district is in mica slate, similar to the killas (slates) of Cornwall. Through these slates, as in those of Coruwall, gravites and sienites have been protruded, at frequent intervals. On the Copper Mine River, the enclosing rock consists of trap and stode, with occasional layers of limestone.
In Lower Caltfornia and Carmen Islands, we learn from verbal communication that the enclosing conntry of the copper veins coosists almost altogether of igneous rocks.
From the above data it will be seen that copper ores are
found in almost all positions, fron the most recent clay slates and detritus to granites, but invariably either in actual contact with or in the immediate vfcinity of igneous or metanmorphic rocks. Perhaps no metal presents more nififor evidence of an origin derived from an igneous agency than copper in its various ores. Of its origia we shall speak at-a future time.
With the exception of iron no metal, used extensively in the arts, is more generally distributed than copper. There is scarcely a known country on the globe where it has not been found in workable quantities.
It is hardly necessary that we should occupy space in a journal for California readers, to direct them how to find or trace a mineral vein; yet a few brief hints to aid the prospector in determining when he has found a copper vein may not be out of place.

## TO TEST COPPER ORES.

Perhaps there is no characteristic of copper veins so general as their color. Whenever amineral of a green or blue color is met with the presence of copper may be reasonably suspected.
A very simple and ready method to test the presence of copper in any ore is to drop a little nitric acid upon it, and after a short time dip a feather into the acid, and wipe it over the blade of a knife. If there be the least quantity of copper in it, the same will be precipitated on the knife. Perhaps a simplir mode than this cannot be named.
A blow-pipe test may readily be made as follows:-Place a small piece of copper ore, with a little borax on a piece of charcoal, and apply the flame of a blow-pipe, when if any copper is present it will soon show itself in a small globule. Again take a small quantity of the ore and pulverise it ; place the powder in a small vial, add three or four times its bulk of nitric acid, which will soon dissolve the powder; then add a little water, and dip the point of a knife, or any piece of bright iron into the liquid. If copper is present the iron will be found coated with it.

## CHARACTERISTICS OF COPPER ORES.

The ores of copper are quite numerous and present a great diversity of uppearance, yet they are all very readily distinguished, each from the other, by certain unmistakable characteristics, which are rendered familiar by a very little attention. The presence of copper in any ore having been det ermined by the "tests" above given the character of the ore can, in most instances, be determiued by the following description:-

The ores of copper are divided, by metallurgists, into 13 different classes, and each class is subdivided into many varieties. The richest of the ordinary ores appear under two general aspects: the first having a metalic listre of copper red, brass yellow, iron or blackish gray, at times iuclined to blue; the second is without metailic appearance, of a reddish color, verging upon purple, blue or green, the last being the most usual tint. The classes of ore most frequently occurring are Native Copper, Sulphuret of Copper, Copper Pyrites, Gray Copper, Sulphate of Copper, Carbonate of Copper and Arseniate of Copper. The most common are sulphurets and oxides, the former being the most abundant. Sulphuret of Copper occurs in all considerable copper districts, and is very abundant in California. 'The color of this ore is a blackish lead gray, approaching, at times to tarnished blue or green. It is considered one of the richest ores, and generally occurs in very heavy veins.
Copper Pyrites greatly resembles, in appearance, sulphuret, of iron, common in the gold bearing quartz of this State. The color of the Pyrites is brass yellow, sulbject to tarnish, with greenish black streak and uneven fracture.
Copper Pyrites are readily distipguished from iron pyrites, which they greatly resemble, by their inferior hardness; they may be cut with a knife. while iron pyrites will strike fire with steel. A marked dffierence may. bo also be noticed in the effects of nitric acid upon the two substances, They do not form so rich an ore as sulphurets. The richness of the pyrites may generally be judged by their color. If they present a fine yellow hue, and readily yield to the hammer, they may be considered a good ore; but if they are hard and of a pale yellow color, they are mixed with iron pyrites zand consequently comparatively barren of copper and constitute a poor quality of ore.

Carbonate of Copper is of a blue or light green color, with
pale green streak. It often occurs in beautiful green crysta 1 s It is also known as Malachite. Green Malachite or Green Carbonate of Copper admits of a high polish, like marble,and When obtained in large slabs, is often formed into tables, manIle peices, etc.
Arseniale of copper is of various shades of olive Green, and sometimes occurs in beaatiful blue erystals. It readily melts before the blow-pipe, throwing off fumes of garlic odor. I'his ore is but little worked.
Gray Copper ore is of steel gray color,more or less deep, either bright or dull. The value of this ore is often very materially increased by reason of the silver which it coutains.
It is generully acconpanied, to a greater or less extent with copper pyrites.
Sulphate of Copper (Blue Vitriol,) is similarto the artificial ealt of the labratory. The water flowing from mines of this of ore is of a blue tint, caused by the solution of this salt.
Copper is easily obtained from this water, in a metalic state by depositing peices of scrap iron in it.
The ores above named are about all the oxes of copper which are worked to any extent.
The copper of Lake Superior contains about 3-1 gths of one per cent of silver. The copper of this State, mostly if not all, doubtless contains au appreciable quantity of both gold and silver. Of this we shall probably receive more deffinita knowledge when full returns are received from ores which have been sent East for reduction. A little metallurgical knowledge will be found of vast importance to the miner everywhere, and especilly in California, where the mineral deposits assume such unprecedented profusion. Our miners according to present indications, will soon become as familliar with copper ores, as they have, for the last ten years, been with gold.

Copper Mining.-We would eall the especial attention of those of our readers, who are interested in copper mining, to the letter of our Calaveras County correspondent, who writes over the signature of "Copper Miner." He is a gentleman of much practical experience in working and concentrating copper ores, having been thoroughly schooled, in that business, both in Cornwall and in the Lake Superior copper region. He has taken the liberty to criticise pretty freely upon some of the past working in the mines whick he has visited. Of course he is risponsible for what he says, and even if he rany err in judgment, in some cases, no evil need to come of it. A fair open criticism and deareription of our mines and mining operations is what we want. It is the only way to obtain practical information, such as will lead to progress and success in mining enterprise. We want information with regard to processes and modes of working, both in the mill and mine. We are promised other letters from our Calaveras correspondent. We trust and be lieve they will be read with interest and profit. If any parties should think they have been unjus ly criticised or spoken of, our columns are open to reply. Discussion is pretty sure to elicit truth and that's what we want. We shall give some valuable and practical information with regard to the mode and proces es for concentrating copper ores, as soon as we can secure the necessary data, which will be within two or three weeks.

Specimensfrom Humboldt. - We have examined some specimens, handed in by Mr. Trotier from Union City, from the Cassins Company, Bratus Ledge, which was mentioned by our Humboldt correspondent of last week. The specimens before us were received a few days since and look well for both gold and silver. Assays from this Company's ore range from $\$ 171$ to $\$ 1000$; taking the lowest and the highest figures, a small percentage of which is gold. The Cassius is an incorporated Company. F. R. Jenkins is Sec. and M. D. Howell, Prest.; Office W. B. Cook \& Co's Stationery store Montgoniery Street. The Company are now mak ing arrangements for properly opening the ledge, with a view to the commencement of active operations.

More Dividend-paying Companies.-The Daney Gold ailver Mining Co., Devi'ls Ga'e Distriet, N. To, pay a dividend of $\$ 14$ a foot to day. The Uniou Gold Mining Company) Howland Flat, Sierra county, Cal.) announce a dividend of 3 per cent. on their capital stock.

We notice the removal of our friend A.J. Moulder, Esq., Stock Broker, to a Epracions Office. No. 605 Montgomery St. Which place
R. C. Page. \& Co.

## REMARKS.

## Stocks which have been dull for the past cen days are beginning to show

 signs of returoling activity.The Bajazette has agitated the market conaiderablyipithin the past two weeks, haviog been operated upon jretty freely by both the bulls and bears. This company is in possession of a large andrich ledge, but serious doubts are eatertained by many whether it may not be ideutical with the Potorl, and ovontunlly clamed by them. Wequote it $a, \$ 3 b$ (a) $\$ 40$, an adyanee on last week. The Belvidere is active at $\$ 123$ (a) 45 ; sales of 60 or 70 feet were made on Tuesday last at theas ligures. We understand from private sources chat question of title to a portion of their ground, with the Chollar company has been cumpromised, on terms cousidered highly adrantageous to the Belvidere.
Cunsiderable activity has been observod in Union and Priucuss, of Gold Hill, both having materially advanced during the week. The mines of both these cumpanies are being rapidly devulopod, with taust flattoring

York has beon in considerable demand of late at umproved rates. Thia company adjoins the Mosieow on the corth, and it is said they have struok very good rock, 50 feet from the surfate
Buruside is becoming quiet again, the late advance not haviug been sus ained by the expected a volopments.
For geueralatute of pricas wo rafor to our Stock List.

## WHEELER'S

Amalgamating and Separating Pans.
It is acknowledged by all who have examined the principles and wituessed the operation of these Pans, that they are decidedly superior for trituraling and amalga-
mating purposes to any other in use. mating purposes to any other in use.
The minst important principle connected with the ope-
ration of these PaDs is the separatinn of the trituratiog ration of these Pans is the separatinn of the trituratiog
process from th:t of extracting the amalgam from the sand. The chict cause of loss of the precious metals ari-
ses from the passing of of the same in comlimation with ses from the passing of of the same in comlimation with
the quieksilver, during the proces of trituration, and in cleaning up. By the introduction of the Separating Pan to $f$, llow the trituration this loss is entirely aroided. In working these machines there is no appreciable loss
quicksilver, and hence none of the precious metals. uilissilver, and hence none of the precious metals. Where these Pans have been introduced and operated
oy the side of others on sands from the same vat, the oy the side of others on sands from the same vat, the
Wheeler Pans have uniformly gained a large percentage of metals over its competitors, as well as a still largel percevlage in the ampuut of worb performed.
"f: 'These Pans man be seen in daily operation, at the
Miner's Foundry, on First street in this city where al Miner's Foundry, on First street in this city, where al nol6-tif ZENAS WHERLER.

## SPECIAL NOTICE.

We wish it listincrly understond that all the interest which Julius Silversmith ever had in the Mining and Scientifie Priss, ceased in Nuvember of 1862. Eifer \& Smitu are now the publishers and proprietors.

## FROM THE AMADOR COPPER MINES.

Jachson, May 25, 1863.
Mr Eiditar :--I semel herewith a box of specimens from the Oriental Company's Claim on the Oriental C'opper Lode. No. I is taken from the most promineut croppings. in the middle of the claim. IFere the walls stand apart 20 feet, and bet ween them is what ull copper miners call a "bloom," indicating an immense mine. The walls and the gossan between them, are well defined through one thousand feet of the cla m, in a straight line. No. 2, is from one of the boulders of ore that were fund on the rein above the surface. No such ore is found in any part of the rein except sear the surfuce.

The gangue has all the varieties common to well defined lodes, three specimens of which I send you. The malachite occurs near thesurface. Then comes the "harn ore" and red oxide, rich in copper, occurs, as the casing of the rein, and at the depth of 25 feet, give place to the black oxides, containing copper aud silver, with traces of gold. 'This casing lugs the head wall, and is but a few iaches thick. Next to this occurs a solid rein of black oxide and yellow and gray sulphates of copper, varying from one foot to five in thickness. The "live muxdic" then occurs filing the balance of the lode to the fout wall.

We have, as yet, only fainly commenced to open this mine. As we proceed I will keep you posted as to all new developments. The shaft we are now putting down is by no means on the best part of the mine, and the most interesting developments are jet to be made.

The lodes in this district run North, $15^{\circ}$ West, and South $15^{\circ}$ East, and the underlie, or dip is to the East from 10 to 20 degrees.

The Cosscmeses Co., whose mive is near and West of the Oriental have out, and ready for shipment from Five to Seven Hiundred Tons of excellent ore. These two and the Newton mine are the only ones in Amador crunty which are taking out ore in large quantities; but several others are being opened with sp'endid prospects. Thousands of dollars are chauging hands, daily, in this County, on Copper "feet," but the mines that are opened the best, and which are rich beyond a doubt, are not in the market. You will please take notice, down at the Bay, that little Amador is an immensely rich County. More anon.
Yours Truly, I. B. FISH.

A Grand Union Promenade Concert will be given by the Temperance Societies of San Francisco, in aid of Mr. H. 'T. Sllfer, on Thursday Evening, June 11, 1863, at Platt's Mall. Ticket, (admitting Gentleman and Lady,) One Dullar.

THE DEL NORTE COPPER MINES.
We learn from a gentleman recently frem the Del Norte Copper Region, that heary slipments of ore may soon be expected from that quarter. The luck of road communication between the mines and the seaboard has hitherto been a great hivdrance to the working of the mines of that region, as energetially as their developments warrant. This inconrenience has now howerer beenina great measure overcome and the miners have already commenced work in earnest. The Aita Company have about 400 tuns now ready for moving, and their ninue is so opened that they can easily raise fully 2000 tuns additisnal b fore the raining sea:on sets in. The Eroca Company are also raising goud shipping ore and have several tons already upon the surface. New d:velopments and important discoveries are constantly being made and the excitement consequent therenpon is drawing off day laborers to an extent which if continued will render it impossible for the old companies to procure the necessury labor to continue their regular working.

We have the promise of full and regulur correspondence, which will keep our readers posted with regard to mining progress in that district.
We would take occasion to mention, in this connection, that persons interested in the mines of this region, or desirous to become acquainted with their locations, will find a very full and accurate lithograph map of this country, giving the location of the principal mines, roads, ete., at Bancroft'e on Montgomery Street. This map has been carefully pre pared by Mr. R. B. Randall, County Survejor of Del Norte, and will be found very full and correct.

## THE HUMBOLDT SALT MINE.

The Salt Mine of the Humboldt District has been carefully surveyed, and fully taken up and rocorded. 'The entire sur vey embraces 17,000 acres. The salt deposit covers an area of 11,000 acres ; the balance of 6,000 acres included in the survey, consists of salt marsh of the stongest brine. This marsh has been included in the survey for the purpose of preventing outsiders from coming in and manufacturing salt from this brine, and thus interfering with the monopoly which the holders of the depos $t$ hope to maintain. Under a monopoly of the kind forshadowed, this deposit must become very valuable, as it lays directly on the probable track of the Pacific Railroad, and immense quantities will soon be required for the treatmeat of silver ores, in addition to that needed for domestic purposes. We presume the entire location will eventually be consolidated into one Company
The valley in which this remarkable deposit is found is supposed to be abont 500 feet below the bed of the Humboldt River, and is a region of the most intense heat in the summer season. The depth to which the salt reaches is unknown. On snking into it, water or rather brine commen. ces percolating into the shaft or excavation at the depth of five or six fet, and an opening thus made will, in 2 few hours fill quite up to the surface of the deposit. This wa
ter will, by crrystalization, soon become a solid mass if the purest and whitest salt. The depth of the deposit has not beeu ascer aied, and probably never will be known. The quality of the salt has been found, by caroful analysis, to be very superior, fully equal to the best Iiverpool. A wagon road is now in prucess of construction to conuect the Salt Mines with Reese River.

## GOLD MINING IN WALES, ENGLAND.

We have received a communication from our former fellow citizen, J. Moshemar, Eson, now operating among the mines of Dalgelly, in North Wales. Mr. M. writes, iu substance, as follows, with regard to those newly developed gid fields:
"If I should tell you that there are, in reality, good gold mines in Wales, you would place just as much confidence in the statement as the people of California did in the first reports of the discovery of silver mives in Washoe. So it is here. People in London, not only the common people, but scientific men also, will not believe what they can learn, hy the evidence of their own senses, in a journay of 12 hours. They are so prejudiced in the matter that they pronounce it all a humbug that paying gold mines exist withon a few hours ride of London. Yet it is a fact 448 lbs of gold has recently been taken from a single mine in Wrales. When I first talked of visiting these mines, pecple in London said to me, "dou't go down there, it is not worth इour while; there. is no gold mine there that will pay."
I nevertheless went, and have since put up machinery, worked some of the ore, and obtained about one ounce per ton, and I am now putting up six Reduction Works-for different Companies."
Mr. M. writes that in addition to the unibelief which so generally exists, with regard to the reality of the gold. mines, there is also a great lack of knoucledge with regard. to minir ing for gold. Much prejudice also exists in relation to the introduction of any foreigu appliance for the saving of golid or the reduction of its ores, and our correspondent thindis if the mines are generally found to pay it will not be in consequence of the skill displayed in working them, but because the mines are rich and labor cheap. He also writes that the loss in working is enormous, and that if any person rentures to suggest any new appliance he will not be listened to a noment. Mr. M. is throughly conversant witb regard to late improvements in working ores both in California and Germany, either of which countries he considers for ah. ad' of Wales in the particular sp: ciality of gold mining.
We should be pleased to hear often from our correspondent, but would euggest that he should endeavor to be as liberal as possible in regard to pre-existing modes and ideas. of working. California as well as England, and indeed, ev-ery other country, is usually extremely sensitive about casting aside established ideas and modes of mechavical operation for that which is new or, to them, untried. Mr. M.. however, is taking the right method to crnvert his unbelieving neighbors by putting his new machinery to actual test.. Men will seldom refuse to acknowledge the evidence of their senses, especially when it bears directly upon their pockets.

## WATER PRESSURE AS A MOTIVE POWER.

Among the many problems that science offers her vota ries for solution, none perhaps have attracted more attention than the attamment of the most economical and safest application of power to machinery. The application of steam and the introduction of coal have wrought greater changes in the world, during the past ceatury; than all other human appliances combined, from the days of Archemides to the present era. The great mechanical study of the present time is the possibility of superceding steam. Air, electricity and water or hydraulic pressure, are the means suught to be employed in accomplishing this object. Errickson has already made bimself famous by his efforts in one -lirection, aud something approximating to practicabillity has beeu accomplished ia bringing into suljection the subthe though tremendous power of electricity. Many insentors are also in the field searching for some mechanical contrirance by which to render arailable, for motive purposes, the powerful force exhibited in the ordinary ITydraulic Press. Motion, to a limited extent, aud in a rectilinear direction, is eas ly communicaterd to a column of water; but the difficulties in the way of its practical application for driving machine $y$, must appear to all cotrersant with ordina ry hydraulic op rations, as rery great. Still, various mechanical contriances have, from time to time, been derised which to a great extent, have evercome these difficulties. The first machine of thiskind, of which we have seen auy notice, was erected in England in 1765 . Improvements have heen made from time to time, by other inventors. These machines were at first coustructed for pumping, at the mines and like the early steam engines used for such purposes, the upward movement of the piston was produced by 2 weighty leverage. Cyl nders are now, however, constructed, much after the manner of the ordinary steam cylinder, aud the water is made to drive the piston rod in both directions. All engine is now at work iu the Alport mives, Derbyshire, England, with a cylinder 50 inches dianeter with 10 foot stroke, es imated at 108 horse power. A nother engine of somewhat differeat construction, but by the same make, is in operation at the Minera Mines in Nirth Wales, with a 35 -inch cylinder, 10 -foot stroke, pressure column of water 227 feet high. pressure on the pistou 98 lbs. per square inch, in a total weight of 40 tons on the piston. This machine is saiả to work very satisfactorily, recquiriug no personal attendance. The motion is certain and continuous so long as the working parts remain in order; consequently the cost of maintaining it is of the most triffing amount.

A late Inglish paper gives a description of still another machine of this sort, recently invented by Mr. Henry J, Lewis, an Engineer connected with the water works establishnent of Wolverhampton, Eng. This machine is now doing the actual work of a large stenm engine, in the most satisfontory maner. Its mechanism in appearance is much the same as that of the steamenciue, with the exception that it has two globes or air vessels upon the cylinder. The action is very simple. The water is supplied to the engine from the main by means of an ordinary pipe, and can be turned on or off by means of a common stop-cock at pleasure. When the engine is about to be set to work, the water is allowed to pass into a chest or nozzle, within which is a slide-valve, the same as is used in a steam-engine. The water, having filled the nozzle, rushes through the passage that is not covered by the slide-valve into the cylinder, forcing the piston along with it, at the same time compressing the air in one of the globes or air-vessels until the slidevalve shnts the passage ; when the air that is now compressed in the one glube, by giving a certain amount of elasticity to the water acting on the piston, enables the cramk to continue its motion. After the volve has covered the one pas sage, preparatory to opening the other passage for the return stroke of the engine, the same process is repeated. Thr. rectilinuar motion is converted into a rotaly motion by means of a comnecting rod and crank, and applied to the purpose for which it is required by ordinary pulley bands.

The advantages which would attend the successful intro duction of water pressure engines must be very great. Such machines could be used wherever it is convenient to take water from a main service pipe, in cities or elsewhere, or Wherever a small supply of runving water can be obtaioed at a great elevation-an incline of any exteut being equally as available as a perpendicular fall. No boiler or boiler fix-
ings or cumbersome water-wheel would be needed. There is going on, yet there are some very fine ledges there. The would of course be perfect freedom from danger by explo- Mounlight heading the list of course.
sion. It wonld require no supervision beyond the mere turning of a stop-cock to start or stop it. It may be workedat long or short intervals and no time need be lost in "firing up." The construction according to the above description is very simple and would in consequence be of slight cost, while the charge for water would be much less, even when purchaved as in cities, than the expense incured for coal and attendance upon a stean engine.
Au engine possessing such advantages would be of incalculable value in California where its applicability would be so extensive for the, varions purpos:s of pumping, lifting milling, \&c.

## HUMBOLDT CORRESPONDENCE.

Unionville, N. T. May 21, 1863.
Editor Mining and Solentific Press.-In my last letter I confined myself principally to Buena Vista District. I shall endenvor now to po tyour readers upon some of the other districts although I am not so well posted myself as I might wish to be. I will commence with Star which has the Sheba, Mammoth, Frau'lin, Yaukee, Jeff. Davis, Daniel Webster and many other very good ledges. The Sheba already has a great reputation in your city, and as nothing that I could write would be likely to increase the confidence of yourcitizens in the richness of that mine, I will simply say that scieutific and practical miners bave pronounced it the richest mine in the rorkl. They are at work on the Jeff Daris, Webster, Yankee and American Bason Companies' clams. All of these ledges are supposed to be good and they will all soon be opened in fine style. In Star' district also is the San Bernard ledge which is the best defined of any ledge in the frumboldt mines. It crops out from eight to twelve feet wide and about three miles in length. The Enterprise, Eamle and San Benard Companies are now at work sinking shafts on each of their claims. This ledge runs across the momitain into Humboldt district. Ihe mineral is of a superior quality and pretty well defined through the ledge. In Santa Clara several companies are at work, tmong them are the Magna Charta, Kentucky, Lxcelsior and W yoming. The W yoming, Union and 'Tehama companies have recently filed their articles of incorporation. The principal place of business of these companies is Santa Clara with a branch office in San Francisco.

## nembordt district.

In Humbald 1 istrict they are at work on the Winnemucca. Jenny Lind, Melrose, Munboldt and Critenden ledges, most of them taking out paying ore. The Highland ledge, in this district is rery rich and well defived and ar rangements are now being made to have it opened.

## sierra district.

In Sierra District considerable work is going on. The Auld Lang fyne company are now hauling rock to Homfray's mill for crushing. The Cresus is also at work with fine prospects. The Douglen, Badger and Annie ledges are looking up.

> alabama drstrict.

In Alabama District the Oro Fino Company are running their tunnel as fast as possible ; will probably be in within a month.
The Bowling Green and Glenbrook companies filed their articles of incorporation last week-incorporatiug in this Tervitory. The former with a capital stock of three hundred thousand and the latter with a capital stock of ane hundred and eighty thousand dollars. The Bowling Green ledge is thirty feet wide and rich in silver on top and nothing to do but haul the rock to the mill and bave it crushed In this district is the Solo, Missouri, Golden Fleece and many other rich ledges.

## table mol-stain district.

In 'Table Mountain district the Champion and Silver Cord odges are taking the lead. They are both very wide and well defined. The shaft on the Champion is down about fifty feet and they are taking out some excellent ore. In Echo district the Washington conipany are sinking their shaft as fast as possible and taking out some fine specinens of native silrer.
In I'dian and American districts but little

In Buena Vista the work of opening clainis is going on briskly. Many companies are being incoxporated. Some of them in San Franci-co, but most of them in this 'l'erritory. A road has recently been laid out from this place to the Salt Mines, e-mnecting with the Reese River road or at the mouth of Cottonwood Canon on the Overland Route at Fairriew Station, making the distance from this place 1 Reese River eighty miles.

Near Cotton Canon is a high range of mountains which bear erident signs of violent voleanic liruptions and, from the indications, a budy of burning lava must be near the suface. Not a particle of regetation can be seen, aud upon remoring the crust or surface for a depth of thur or five inches the heat is quite intense. Near the mountain brimstone is found in considerable quantities, also fine sjecimens of native conper.

## extent of the numboldt mints, de

What is now known as the Lumbldt mines is double extent to what it was six months ago. The Last Range i beginning to attract as much notice as any orher portion the nines. Most of the ledges there are large and well d fincu and as fur as prospected they are rich.
'limber is quite plentiful on the East Range, which is no mall item in a mining country; but the old Humboldters will still keep ou prospecting and extending their prospect ing tours to the second and even third ranges lia-t. I hope the imegration from Califoruia will lse composed of men who are not afraid to exercise their muscle. and that they will be content to devel p and work the ledges that the ueasy and ving adventure 8 find for them.
Our country is settling up quite rapidly and I presume from what I can leam by parties recontly froni Californin, that the arrivals at the present time are nothing to be compared to what they will be in a few weeks. But let them come there is work and room enonto for all that may arrive and if they are not satisfied with the country they will ceitainly differ with

Quartz.
Imprormants - Numerous substantial improrements are constantly being manle on all the principlal business streets throughout the city. Indeed the prospects of our city aud state were never so flattering as at this present time. 'I'lie astonishing developments of the principal silver mines on the Eastern Slope; the coutinued, if not increasing yield of the gold mines within our own state, and the now settled conviction. that we are just entering upon a new branch of mining, which is scon destined to fulty ergual in importarce either silver or gold, is inspiring capitalists with a drg ee of confidence in the permanency and growth of our city, which they never before have felt. This confidonce is erery where manifesting itself in valuable city improvements, and in the construction of a vast amount of hervy machnery for the still further development of our mines. San Francisco is now making most rapid advancement in both commercial and mechanical enterprise. With the development of the mines, especially thase of copper, commorce and mechanics must go hand in hand, and will coutinue "marchiug ou," until the Queen City of the Tacific shall occupy a position in the foremost rank of the great cities of the world.

Impression of Leates.-Take half a sheet of fine paper and cover the surface with sweet oil. Let it stand a minu'e or two, then rub off the superficial oil and hang the paper in the air ; when almost dry, more the paper slowly over the flame of a lamp or candle till it is perfectly black. Lay on it the plant or leaf; place a piere of clean paper over and rub it equally with the fingers for half a minute; then place the plant or leaf on the scrap-book where it is desired to have the impression; cover it withbloting paper, and on repeating the rubhing a representation of the plant will appear, equal to the finest engraving.
New Subway in Londox.- \& new subway for gas and water mains is talked of in Lond in, and cere long every promnent s'reet in that city will be tuuneled loy a subterranean receptacle for the numerous mains which anderlicall the thoroughfares. They would certainly save much aunojance and expence, by avoiding the necessity of so frequently breaking up the streets, as is now indispen able whenever water or gas is introduced juto a loouse.

## MINING AND SCIENTIFIC PRESS.

## RAILROAD FROM MARYSVILLE TO OREGON.

S. (i. El init. Jisq., of A uburn, has recently returned forn a peliminary examination for a railroad from MarysHo to ()resal. The di-tace is about tion m"los. and the Gute is frnanded eminently practicablo, and atmissibte of by gradi is ith the excerption of a section of about 50 miles for the menntains from Klamath to Rogne Rirges. With his pacepti es the roal is mostly through level valleys. Mons y enough his hern gramanteed afong the proposed tine of fer road to erey for a preliminary survey, which will be nurtaken f.athith. Uregon, Inerior and Sorthern Calirnia are riol in iron, coal, copper, lumber, fruit, arricultuI productions. wod, ate., all of which would find a market od cheap tramsportion orer the proposed railmad. The "ple and th, "solid men" along the route and all throumb pe interion if rewom are enthasiastic for the roxd. Its ,nstruction! at an early day, will be fond not unly a conrience hat an imporative necessity.

Iichinon tim: Mmad Witers of the Missouri-Mr. Bur--igh, the lialian Agent, writes to Commissonev Dule, at Fashingom, that gold in immense quautities has recently fen disencem near the head waters of the Missouri, 200 iles west of Fort Bentow. The 800 miners who are alady there lime Cilifornia and Columbia River, are aver-

 Inclish! palpur from Otago, New Zealand, estiante the wekly pru?cct of gollat that point at 10.000 to 15,000 ances, equn! t. Sin, 1100,000 a year. New gold fields were eing oren ! in all directions.
 on from Tunktu, France, in the Messenger du Midi, says: "The latinur ug of the frigate La Gloire in the Castiguean uck has dieduzed three unexpected phenemena. First, hat the cantuct of the copper lining and the sulmered dron lates hate e=tablished a galvanic current, which prentuced the effect uf: a voltaic pile, and was completely deterinating he armor ail the fricate in the par s below the water lines reol dly, that a spreies of shell ti:h, hitherto unknown. Tras flerwards discovered among the millions of mollusce by thich the hull was corered, apparently produced ureler the hfluence ni the same galranic current; and last! 5 , in the fold of the ressel 22,000 litres of wine were foum to be ransformed into vinegar, it is not known by what influ. nce."

25s Trie new organ which has been imported for Minsic tall, Bostun, is described as a splendid affair. Its cost when finished, will be upwards of $\$ 60,000$.

## TO MINERS AND PROSPECTORS.

In view of the frequent accilental discoreries of valuable phineral depisits, other than gold, in almost erery section of the State, which have of late been mude, it is but reasonahe to sumpuse that prospecting even in California, has but fust commencel. The simplest and most universal of all netaliferous deposits is gold. It rarely occurs in any other form than that of "free gold" which is readily discepmable to he naked eye. An examination of any rock ( 1 earth for cold is an extremely simple process. If its presence is suspected in alluvium, the simpla washing of that alluvinm in a pan is an invariable te-t. If in rock of any description thal rock pounded fine in a mortar and washed, in the same mauner as alluvium, will usually expose its gold to the naked eye, if there is any there in paying quantity. The only exceptions, are where the gold is contained in iron pyrites, or copper pyrites containing also iron. In either of the two latter cases the presen.e of gold may be readily ascertained by placing the pyrites in any suitalle ressel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the silphitur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual pauning process, may be readily scen by the naked eye.

Not so rith othermetals. Silver, copper, zinc, nickel,
and many others appear in such a great variety of metallif(ruus forms ats generally to dufy all but the must practical and ssimentitie cye. Nis description of these wres can be written which will aflome my very important ain to the inexpronneed in making explonationz. A'ter raubing descriptiuns, however, ched curofully coramining the speceimens foscribed, the explurer may go out and sabell with come degre of confinence sum intilitence A staty of the characteristics of the sulpharet ores aleme, wound hema an expleyr to pass over, cutirely unnoticed, the rehest varinties if the ores known as. Chlorides or llurn silver, which, from the facility with which they may lo worked, and their neval richness, are generally consilered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will he extensirely found in all the volenuic regions of this sitate. So with many other ores.

Considering the great difficulty, in the present luck of calnet collectiors, and other means of instruction, to acquire a practical minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resantecs, we hereby make the offer to m ners, prospectors and all others, who in their travels or explorations may come acruss specimens having the appearance of rarity or value, to carefu'ly examiue and pronounce upon the same, free of charge, as to their char-acteri-tics, value, etc., whenever any such epecimens are brought or seut to this office free of cost to us. We have atready been called upon in many such cases, and we shall at all times be willing to gire our attention to any such requests which may be presented to us.
In canying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. Tne ordinary rocks with which the miner meets III his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at onee bo given to it. There is scarceIy a piece of quartz or rock of a quartzoze nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or nrar a vein of quartz it should be carefully examined "in place." and if the cause of its pecullarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary nineral substances which may be likely to come nuder the notice of the California prospector. 'These articles will be published under the bead of "'Ther Miner's Laboratory," and will be found of great ralne to the mining public. [Mining and Scientific Press, April 20.

Subscribe.-Are you a miver and not a subscriber to the Mining and Scientific Pres? If so, you are au annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, sou can find no papr that will be read with so much eagerness loy them, or one that will convey to them so full an account of the real industry of the country as the Mrsing and Scientific Peess. We invite all to send us their names and four dollars, or two dollars for six months, and hecome patrons of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our nsual castom to receire a subscriber for less than six months; but iuasmuch as we are anxions to introduce the paper where it is not now known, we will, for the present, send the Press for three months erev, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to dipcontue the paper after being a constant readar of it for even that shor't periou.

THE MINERS' TABORATORY.-NO. V.

## mLNDIC-PYRITES.

One of the most common characteristics upon and near the surface of a vein of copper is the appearance of large quasitities of Pyites-sometimes called Nundic. Whenever this mineral is so found, in great abundance, especially if in a region productive of copper, the miner may lave the utmost confidence in prosecuting the work of dereloping his veiu. Pyrites are most usually y llow, varying from nearly the color of gold to an iron white.

Pyrites sometimes contain, mechanically mixed, small quantities of gold. They are then called "auriferous pyrites." The gola mines of California contain layge quantities of this description of mineral, and thonsanos of tons are now being worked for this metal. They are, here, usually concentrated from the sands which hare passed througi the ordi- ary gold amalgamating processes. One of the most extensive and perhaps the most thorough establishments for working uuriferous pyrites, is that carried on by Mr. Deetkin, a short distance from this city, on the sau Bruno road.

Copper pyrite constitute the priveipal ore of th.t mineral, and frequently occur vers massive, occupring the elltire width of a rein, sometimes many feet in thickness, but oftener in strings and bunches comprising but a small percentage of the entire contents of the rein. Copper pyrites is not considered a rich ore. Their yield of copper is usually from 12 to 20 per cent, rarely reaching 25 . The richness of this ore may generally be pretty correctly estimated by its color. If of a fine yellow color and readily yielding to the hammer it may be considered a good ore; but if hard and of a pale yellow color it may be set down a poor quality of ore. The color and consequently the ralue of this ore is attributable to the more or less abundant presence of iron.

## gossax.

We hear u.uch said among copper miners and prospectors for copper, about "gossan," and furthermore that the appearance of gossau is a good indication of copper-and so .it is. The question is also often asked, "What is gossan?" Gossan is nothing more nor less than decomposed munilic, or iron pyrites. It is usually of a yellowish color, some times, howerer, appriaching to black or dark red. The geueral composition of gossans oscilates between the two extreme results as giveu below :-

The term, $g$ sssan, originated in Cornwall, and for a time was local, but is now quite generally used in this country also. The existence of muadic or its common resultant, gossan, is not unir ersal. In some rich mining districts no irou, or rery little at most exists in the veins ; in such, the ferrugineous stain is wanling and gossan is not seen.

In Califomia, we presume, from copper explorations thus far made, and from the general character of all our quartz reins, gossan will be almost universally met with, and whereever it or mundic is found, rich and valuable ores of copper, and possibly of tin may be coufidently looked for at depths rangiug from 15 to 50 feet beseath. Gossan, of itself, is generally of but little ralue, although it sometimes contains small quantities of both gold and silver, and not unfrequently copper. It is often fouud, in small quantities, far down on the vein.
Beneath the gossan, we frequently observe appearances strougly reminding us of the common electrotype process for procuring copper from a solution of sulphate of copper. The pure metal is gathered together in chinks and cavities between the main mass of gossan and the body of the undecomposed copper pyrites, mingling nerhaps with the lower part of the former. Sometimes this native copper, as it is called, may retain its me:allic character; but at others it becomes converted into an oxide, and this again into a carbouate, by the percolation of wa'ers containing common air and carbonic acid.

With regard to the formation of this native copper it is p-obable that the sulphur, by a nuion with the needful oxygen, becomes sulphuric acid, and that, this formed, the oopper is attacked and remov, $d$, to be dealt with like any other solution of the sulphate of copper.

We can hardly conceive it possible that the copper, fluid state, has beeu forced up from below like dikes of porphyry or greenstone. An elastic force sufficient to raise a fluid mass of three times the deusity of lava would shatter the enclosing walls, and force the copper into the fisisures. If this were its origin, we ought to find it occupying the depressions in the surface rocks in the vicinity of the fissures, like modern lava cu rents.

We find the copper investing various crystalized miverals; and every ware and stria of the pre-existing cry-tals is faithfully represented. It is impossible, by any artificial method, to cast any metal su as 10 exhibit such minute lines They are as deli cate and faithful as could be obtained by the electrotype. Again, the associated minerals do not exhibit the effects of a high $t$ :mperature. Also, if the contents of the reins were the result of iujection, their productiveness would be unaffected in their passage through different nineral planes. Lastly, copper and silver combine in indefinite priportions, forming a lomogenenus compound; and yet we find them existing side by side almost chemically pure. Admitting that they once formed a bomogeneous compound, it is reasonable to suppose that they have been separated by electro-chemical agency.
We shall speak more fully of this supposed electrical adion in copper and other mineral reins, in a futu-e number
[We have received, from a thorough and practical minaralogist, a commuaication, con aiuing much raluable information, in addition to what we have air. ady given, explanatory of the various methods by which the presence of copper in any mineral or other matrix may be readily ascertained by the prospector; also a list of the chemicals and other apparatus requisite for such tests. We shall insert the communication, next week, under our Laboratory head.]

## PRACTICAL MEN WANTED.

The Mechanics of San Francisco have inaugnrated a a morement which ourht to commaud the attention of all thinking men throughout the State, and, indeed, throughout all the States. At a meeting of the mechauics, held in this city, on Thursday Evening last, it was resolved that the exigences of the times urgently demand that at least one of the three Representatives to be chosen at the coning election should be a person of kuown practical, mechanical attainments, and one who should be thoroughly posted with regard to the mechanical interests and wants of the State and country.

We most cordially endorse the sentiments and importance attached to the purpose of the meeting above referred to. The Resoiutions have been widely circulated by the press of the city, and their substance will be known to all of our readers before this sheet reaches them. The movement should not be confined to San Francisco, but should be made general throughout the State.
We would beg leave to add one amendment to the morement, and that is, in addition to the selection of a euitable member to represent the mechanical interest, another should be selected with reference to his peculiar fitness to correctly and intelligently represent the minng interest. Let the Miners and Mechanies of the State join hands, and demand, of the convention which is to assemble on the 17th of June next, that they shou'd put in nomination, two individuals who shall be suitable percons to represent the two great leading industrial interests of the State. If they fail in do ing that simple act of justice, l. $t$ such stens be taken forthwith as shall make the politicions, ferl that the mechronics and miners of California are a power in the State, Laving rights and interestsat stake, which cannot be overlooked for the sake of mere political gaiu, or the spoils of office.

Cbange of Name.-What ucas the Hesperian comes to us this week in its old form and with its former Editor, but under a new name. The "Hesperian" and "Pacific Munth$l y$," appear to have joined hands, and the subscribers to both of those periodicals will hereafter be supplied with the new -Pacific Moxtury," published in octavo form and under the Editarial Management of J. D. and M D. Strong. The Editorial corps is a strong team, and we doult not will furnish their readers with a Magazine which shall be a fair ex-

Considerable attention has recently beet attracted to the Peavine Mining District, a locality on the western border of Nevada 'Territory, and a short distance to the northward of the Henness Pass Route. A late correspondent of the Bulletin, of this city, gives some facts with regard to this district which we have condensed as follows:-
The name, "Peavine," had its origin from a solitary vine of that name, which one of its early risitors discovered growing near a spring, and not as generally supposed from an abundance of this nutricious berbage grorving in the val. ley. The most of the ledges now being worked were disdiscovered only some three months since. On a few of these ledges shaits have been suak from 30 to 50 feet, bat on most meiely a little "scratching" has lieen dove to hold thens.
COPPER INDICATIONS \&C.

Most of the ledges show croppings of a greenish substance indicatiug the presence of conper intermixed with coarse grains of gold. This kiud of rock generally runs out at a distance of 15 or 20 fieet from the surface and is succeeded by quartz varying in colors and firmuess as well as in the value of the metal it contains. Other ledges, again, commence with white, blue, black, and yellow quartz, resembling wuch the character of ore discovered in and around the Virgiuia City, and in most of which gold is plainly visible to the naked eye, and which, also, unon a proper test, jield richly in silver.
The lodes located in the hill to the right of the town ap. pear in the following order: The Lucky Lill, White Iliamond, Magnolia, Beril Hammer, Green Mountain, Katy Wakeman, (Iffield, Carondelet and Virginia ledges. Leaving these and passing over the hill to the westward you reach the Lone Star, Mountain Sheep, Dix, Black Hawk, Irish American and Mammoth-a 1 well defincl ledges. T'o the left, and a mile or more distant, you discuver the Young America, Star of the West, Kitty Clyde, White Sugar, Summit, Monitor, and Yuba ledges. The last three named have been but lately discovered, and from present appearances bid fair to excel them all. Some of the rock recently taken out is not only rich in gold and selver, but shows masses of copper almost in its pure state. I am confident that a tuu of this rock now outside of the mine will gield from $\$ 1,000$ to $\$ 2,000 \mathrm{~m}$ gold, and I thitk the copper left will yield from 40 to 60 per cent.; and an assay lately made shows silver to the amount of $\$ 30$ to the tun. Other claims have been carefully tested, both in assays and the old fashioned method of pounding up and panning out, and althoagh they do not cqual the claim spoken of alone, yet they show sufficient "indications" to warrant the belief that they prove" rich. The Lone Star and Young America stand foremost in the list; and in fact there is none whare the ledges are fairly struck that do not show goud proepects. But in order to work these mines successfully, it requires not only patient labor and considerable outlay of money, but what is still more requisite, suitable mills and experienced workmen: That mills can be run here at a small cost is evident from the abundance of wood and water near at hand.
A few days travel by way of Jownieville will bring minong capitalists direct to these mines. The greater part of the travel and transportation from Caliomia to the Humboldtriver will pass this way ly the new road now being built and to be pushed to completion during the present summer.
Ax important improvenuent in nara? architecture has been satisfactorily tested this week. The steamer Kate has been tried at the Nore with a duble screw-an arrangement which enables her to steer herself 1 apially and easily without any use of the rudder, and to turn with the gaeatest facility where ordinary steamers find the operation one of much difficulty. Should the rudder be shot away, thé screws, which are not at all exposed to the enemy's shot, would stil gire complete steering power. [London Spectator, March 7th.

Glue for Ready Use.-To any quantity of glue use whiskey, instead of water. Put both together in a bottle, cork it tight setaway for three days, when it will be fit for use without the appilcation of heat. Glue thus prepared will keep for years, and is at all times fit for use except in cold weather, when it should be set in hot water.

| REMARKS． |  |  |  |  |

The Mining Share Market，for this city was quite dull last rreek，but im proved considerably with the opening of the preseut week．Indeed the week has opened with tonsiderable brisknens．But few stucks have mate－ riblly adranced withiu the past six days，nad fewer still havo rec－derl， while the market has presented less ductuation than for any stantar pe－ riod for many weeks．
In tinh goure five looking rock was struck about a weck since，whech Las had the effect to advance the shares of this Company from $\$ 55$ to $\$ \$ 5$. Badjazelte still coutinues to uttract attention from the Bulls and Bears， and it is a difficuit matter to fix its value in this market．It may，per－ haps，be quoted at about last wotk＇s Ggure．This stock was the theme of considerable comment on Thursilay last，in consequence of that day beng the expiration of the term for the delivery of 200 feet of its stock at $\$ 35$ ，
a figure considerably below the ruling rateg，The stock was delivered， however，and may now be quoted at $\$ 37,2$ to $\$ 40$ ，in light request．
Beach \＆Paxton has been inquired for to－day at $\$ 125$ ，with but little ofr
Sicramento has exhibitel̉ something of a revival，and bas been ouquired for to a cousiderable extent． 100 reet or more hare changed hanis in this market，during the past week，at \＄65（1）\＄72，\％It may sow be quoted at the latter figure，with but little demand．
Belvidere is still in favor at about last week＇s quotations．
Gold kill stocks bave manifested considersble activity，though less than for a rew woeks previous．
Considerable advances have been noticed in Alpha，and Ycllow Jacket， also in Harkere，North America，and Stephenson－Kehoe．The North Amer－ ica is iu brisk demand at $\$ 25$（c）\＄27

HOWLAND, AFGEL \& KIN
San Francisco, February $23,1863$.

## SPECIAL NOTICE.

We wish it distinctly understond that all the interest hich Julius Silveramith ever bad in the Minina and Scienfic Prfss, ceased in Nuvember of 1862. Ewer \& Simith e now the publishers and proprietors.

## POST-OFFICE COMPLAINTS.

We hear frequent complaints from subscribers in various 1arters, with regard to the non reception of papers, and ave found it impossible, in several places to extend our recrlation, for the only reason that the "Press" can not be ptained regularly from the Post-Office. We know not here the fault is. The paper is regularly malled at the San rancisco Office, done up in strong wrappers, and carefully rected. Subscribers who fail toreceive their papers regufly should first learn from their local Office, whether, when e papers do arrive, they come in good order, or whether e wrappers have been removed, etc., and communicate the facts to us. We will then endeavor to learn the cause the irregularity, and so far as possible rectify the same.

Treasure Supprent.-'The shipment of Treasure by the t. Louis of the 3d inst. was as follows:-

## To England. <br> To Panama

$.8766,21443$ 184,484 21
Previously this year.
5,000 00
Total since January 1, 1863.
Corresponding period of 1862
20,51,698 64

Corresponding period of 1862.
$\$ 21,406,83779$
Excess this jear..
$14,596,066 \quad 05$

The large and coustantly inceasing ein e shipments of the last and several provious years, is a bst important and note worthy fact. This excess must be t down exclusively to the credit of Washoe, and will, in probability, reach by the end of the year nearly or quite - excess of $\$ 15,000,000$ over the shipments of 1862 . The oduce of California, in all probability, has failen off the esent season, in consequence of the immense draft upon ar population by the mines of the Eastern Slope, and by eworking and prospecting of the newly developed Coper mines in our own territory, the produce of which will ake no show in our treasure shipments, but go exclusively swell the total of our general exports. We may look for a important increase in that direction, when we come to ose up the product of 1863 .

To Copper Miners.-We would call the especial attenon of those engaged in raising copper ore to the adversement, in another column, of the "Pacific Mineral Comany." This is a new agency recently established in this ty, for the purchase of copper ores. The Company's Office at Room No. 1, Odd Fellows' Hall, Montgomery St.

Tre Creat Chess Player Braten,-Paul Morphy has gain been beaten by Mons. de Riviere in a friendly match t chess-the latter winnig three o..t of five games.

Another New Amalgamator.
Thespirit of invention is still active among our mechanics, and mining improvements come in for their full share of attention. During the past week not less than four appar- ${ }^{\dagger}$ ently important inventions, in this direction, have come un-
der our notice, as Patent Solicitors. Of course we can say nothing about them at present. At some future time the attention of thepublic wlll be called to their importance.
Two weeks since we made allusion to a new Amalgamator recently invented by Mr. Howland, of the Miners' Foundry in this cify. This machine consists of a hollow, stationary, iron drum, with a fan-wheel, having each arm or fan perforated with numerous holes, revolving within the drum at about 350 recolutions a minute. The pulp, or ore after being first quite finely pulverised, is put into the machine through an opening at the top of the drum, and is then beaten and battered about, and forced through the little holes in the pan, until it is further reduced to au impalpable powder, and thoroughly amalgamated the while. The "process" employed is a combination of the Frieberg, Patio and several others, and is in short and in fact an improve ment in both the manner and speed of the Frieberg barrel process. Quite a number of practical silver ore workers have examined the machine, seen its workings-at the Foun-dry-and all, we believe, express faith in its success. A small machine may be seen in operation at the above mentioned Foundry, where they are also constructing one of large dimensions, suitable for the heaviest milling operations.

## More Machinery for Mexico.

The Sunny South is now taking on board a set of machinery for the El Pecacho (The Peak) Gold and Silver Mining Company, located in the San Antonio Mining District, Lower California, and about 20 miles back from Ventana Bay. The proprietors of this mine are all citizens of Nevada, County, where they have filed their papers of incorporation. E. H. Gaylord, of Nevada, is Secretary of the Company, and W. W. Cozzens, President. Charley Barker, one of the pioneers of that County, and an estimab'e gentleman, withall, is the general Agent of the Company. The machinery has been constructed in this city, under his direction ; Palmer, Hanscom \& Co., of the Golden State Foundry, being the Contractors. The wood work of the Battery, which, for the present, is but a small one has been constructed at the shop of Mr. E.O. Hunt, on Jessie St., and is a very substantial piece of work. The locality of the Company's Mine is one of the richest in Lower California, and we shall be most happy to chronicle their complete success.

Copper Concentrating Macuinerx.-A splendid, new 40-horse power Engine, from Donahue's Foundry, will be shipped, to-day or to-morrow, designed to drive the Concentrating Works now in process of erection on the Keystone Copper Mine-the wéstern extension of the Union. A large number of nechanics are now engaged in getting up the machinery at the mine.
We notice a statement in a paper published in this city,
ed a machine for concentrating the ores of copper, which we understaud, is operated upon the principle of the commou gold sluice. Such machinery will be found impractica ble when applied to copper. The specific gravity of copper is so much less than that of gold, that a principle which will work most advantageously in the latter metal, will be found entirely useless when applied to the former. The business of concentrating copper ores, though simple in its process, is one of the most difficult of the arts of mining to carry into actual practice, and requires infinitely more skill and attention than the usual processes for separating gold from its sands.

## A New Work-Important to all Mining Companies.

Wm. A. Andrews \& Co., a new firm in New York, who propose to open a Pacific Mining Agency in that city, are preparing a work to be issued about the last of July, embracing a synoptical statement of all Mining Oo's in this State and the adjoining Territories. Tt will be published in pamphlet form, and 50,000 copies distributed, gratis, in the Eastera States, with the intention of bringing Pacific Mining Stocks more particularly to notice in the East, for investment and information of the mass of the people, outside of the leading capitalists of New York and Eastern cities. Such enmpanies as are promineut befere the public, and those whose prospects are deemed worthy, will be embraced in the 1st Volume. A 2 od Volume will be issued to include all new companies formed subsequent to the compilation of the Ist. An opportunity will be offered to advertisers, for a few outside pages in the work. Mr, Legir Harnett is Advertising Agent; and Mr. J. A. Woodson, San Francisco Corresponding Agent, of whom further information can be had.
All Compauies upon whom the Ageuts have not called, will please address us as above, and answer, as full as may be, the following questions :-

1. Name of Company.
2. When discovered.
3. Where located.
4. When incorporated, and where.
5. Extent of Clain.
6. Capital Stock.
7. No. of Shares.
8. Assay per ton : Gold, Silver, and Copper.
9. President and Secretary, Board of Trust's.
10. Location of Office.

I1. Such additional information as may not bo embraced in answers to the foregoing interrogatories.
Note.-Specimens of Ore requested, labeled, for reference a Cabinet of New York Office.
W. A. ANDREWS \& Co.,

Pacific Mining Stock Agents, New York.
To Copper Ore Sellers.-Martin \& Co, at their Office, 224 Montgomery St., are prepared to contract for the purchase of copper ores, assaying from eight per cent, and upward to the ton. They will make advances, etc., when desired. See their Advertisement.

Important Silver Discoveries are rerorted to have recently been made on the West bank of Lake Bigler. A tuwn site has been laid off, mill priviledges taken up, etc.

## OUR MECHANICAI INDUSTRY.

San Francisco is destined to become the Workshop, as well as the Commercial Centre of the Pacific Coast. In adlition to the seven or eight Foundries now in operation in this city, all of which are conducted by wealthy capitalists and experienced mechanics, we also find, scattered here and there, numerous Machine Shops of less pretentions dimensions, but where employees and managera are equally as well skilled, as any in the city; and many of whom, no doubt, in the future grow th of our metropolis, are destined to enlarge their field of operations until, by gradual advanses, they reach the point of first class establishments. Among the several establishments of this class which have already found a place in our note book, for special notice, is that of

> E. T. steen's machine shop,

No. 33, Fremont Street. Mr. S. is at the present time engaged in the manufacture and sale of several new and useful articles of machinery, which are fast finding favor among those engaged in general mechauical operations.

One of the most useful of these articles is "Reynolds' Patent Cut-off and Governor for Steam Engines." Among all the vaxious contrivances for reserving power in the application of steam, by regulating the quantity used to the exact necessity of the moment, that above named appears to be the most perfect, prompt and reliable. To saw mills, printing presses and, indeel, all machinery where the work to be accomplished is very irregular in its requirement of power, one of these machines will effect a saving of from 20 to 60 per cent. of fuel. A large number of these machines are now in use in California and Nevada Territory.

Mr. Steen has himself invented a machine of this description, which he also manufactures and has for sale. His modesty does not allow him to say much of his own invention, but it will speak for itself and may be seen at the Goldea State Foundry and at the Stone Breaker, at the foot of Market St.

Another very useful economiser of fuel and power in the use of steam is "Clark's Steam and Fire Regulator, which regulates the draft or blast of the furnace by the preasure of steam in the boiler. This is quite a novel as well as useful invention, as will be readily seen on examination of the machine in use, or by a little reflection upon what such a ma chine properly constructed, might accomplish.

Mr. Steen also manufactures "Ingersol's Patent Drill Braces." If any person is desirous to learn the value of this recent invention let him go through the Machine Shops on First St., or merely notice the work going on in the street aud on the sidewalk in frout of most of those establishments. Notice a workman yonder, with one of the old fashioned racket-drills, with the slow clatching motion confined to one direction, and every second motion entirely lost to gain leverage. Now go on a little further and see that man with one of Ing ersol's Patent Drills. The motion of the handle is not confin ed to any particular direction, and every movement, in whatever direction it is made, turos the drill and eat's into the irou. To us, the use of this new instrument appears equal to a saving of from one quarter to one half in time-an important point in an ecomomical riew, at California prices of labor.

Mr. Steen has also introduced into this State, an invention of especial importance to persons using steam in most localities here. There are fery places in California where pure water can be obtained for making steam. The numerous mineral substances contained in the waters of this State, cause much annoyance by their tendency to produce scale in boilers. "Blowiag off" at frequent intervals, in many cases fails to keep the boilers in good condition. Mr. Steen is selling on "Anti Incrustation Powder," which is said to be a sure remedy against this annoyance. This powder has been in use at the East for eight years, and is being very generally introduced there, and working its way into use iu this State. Reference, as to its utility, is made to the Sugar Refinery in this city, and to L. A. Booth \& Co. at Virginia City, also to others.
We have made this extended notice not so much for a puff for Mr. Steen, as to call the attention of our machinists and mill men to the valuable improvements to which reference has been made. Mr. S. properly appreciates the adpantages of advertising, and displays excellent judgment in

- ectivg his medium. Our rambles among the workshops
of the city, however, will not be confined exclusively to those who may, for the time being, see fit, or think it for their interest to extend patronage to us. All alike will be visited and noticed in turn; and while we would not importune any one for their patronage, re shall ever be happy to receive and acknowledge farors from all. We hope, as time progresses, to be able to make the Press more and more useful to our mechanical as well as mining interest.

## NOTES OF A TRIP TO SLATE RANGE VIA. LOS ANGELES AND EL-PASO. NO. 2.

Thursday, April 9th. Left Mayhew'sabout 10 A. M. and traveled over a portion of the immense plain lying between Los Angeles and the Ocean.

The land is not all level, though it looks so at a distance. We found some ralleys from fifty to one hundred feet in depth, gradually descending and rising, but no water, no feed for the immense number of horses and cattle, wandering over it. In the bottom of one valley we found a dry river bed which had been cut out by the great rains of '61 and ' 62 , about fifteen feet in depth, the sides of which were steeper than an ordinary cottage roof. Here we thought it impossible for teams to descend, bat our leader, Captain Colby, drove down the first fire yoke, then orderel a halt, locked both hind wheels, and the wheel cattle went over without injury to the wagon, but a piece of machinery which protruded over the top' of the right wagon box, struck into the back of the near ox and gouged him fearfully. Poor fellow! We only made about six miles this day and at 3 P. 3. camped for the night. I found the weather very different on these plains from what it was in Los Angeles. I had thrown aside my under clothing and expected to find it growing warmer, rather than colder as ladvanced. It was a sad mistake, and I suffered from cold nearly all the time. The nights were very cold and I crept into the covered wag. on and made up my bed on the sacks of corn and barley bound to feed the mules in Slate Range.
Apr, 10. Started at $8 \mathrm{~A} . \mathrm{M}$. and passed through a very extensive ranch, called Cowangos, a bearififul ralley, but no feed to be seen, and was told that a little could be found in the valleys at the foot of the mountains 8 to 12 miles distant; but all agreed that there would be terrible suffering this season among the stock in this county.
About this time we came in sight of the San Fernando Mission buildings. They consist of three great adobe blocks, one for a church and the others for dwellings.
This must have been a very extensive establishment at one time. Now it seems deserted and is all going to ruins. Near the buildings, are two very large orehards, enclosed by adobe walls about 8 feet high, and 8 miles in circumference, in many places broken down by the rains and cattle.
I learn that the mission is owned and occapied by Andreas Pico (brother of Ex. Gov. Pico at Los Angeles,) his son and son in-law and their families.
I heard from one of our teamsters that in Sept. one could get a great variety of fruit there, but I could see only the olive tree, and the immense cactus which lined the walls, and also grew in great patches in various parts or gardens. This cactus, little specimens of which are trained so carefully in our city gardens and hot houses, here grows fourteen feet high, the base being nearly a foot through, and those immense, flat, green heads shoot out in all directions, wedged so closely that only the smallest animals can move through them. The ripe fruit upon this plant is highly prized by the natives, aud is brought wato Los Angeles and sold in large quantities.

Camped near by a tile-roofed house near to the entrance to the S'an Ferando Coñon.

Apr. 11. Started at 9 A. sr. and soon entered the Cañon, which resembled a great valley at first, but soon began to contract its limits and after an hour or or so, we began to ascend quite moderately, and about noon came to the summit, and a steeper, sharper pitch for teams to pass I never saw. For about 200 feet the ascent is as great as can possibly be overcome by wheels. Here the teams were doubled, making twelve yoke on each wagon, and every one of them strained every muscle to the utmost, as well as the drivers, who poured out yells and curses and swung and cracked their great Pike County whips, with 11 the rim in their constitutions. After a few moments of
terrible excitement the wagon was safely landed in a deep cut of 50 feet on the summit. This work has been done by Lieut. Beal, who has the contract to inprove this road and put up toll gates. He has already done a good denl upon it and will be able to continue doing so for years. The descent of the summit is not so laborious but more perilous as there is great danger of the wagon sliding down over the road if not the cattle. With both wheels locked the wagon slides down as rapidly as the oxen can be kept out of the way, the wheelers holding back their very best and frequently getting their ears between the yoke and their horns and cutting them dreadfully, so that the blood runs down their necks and drops to the ground. At 1p. M. We camped at the Fountain House, a lovely valley where a large stream of pure water gashes out of the hill and fresh grass grows all around for the cattle. We here found ourselves only 31 miles from Los Angeles, after traveling four days. This must appear to any person as slow progress, but teamsters are obliged to give their cattle every opportunity to gain strength in the first part of the trip in order to get over the latter portion, which becomes more dessolate and harren ss they proceed.
12 re. We made sixteen miles this day and camped in San Francisco Canon-as we passed along the road, wo found the California hare or jackass rabbit very plenty, as many as ten to fifteen in sight nearly all the time within gun shot, aud flocks of quails starting up in every direction. The only vegetation thus far is a dry tea bush, and the greasewood which grows in scattering bunches 10 to 30 feet apart oll over the country, and occasionally the tree cac tas which grows about 10 feet high and is armed with shar pointed bayonet leaves all over the trunk and limbs and then forms in bunches as large as a mau's head, with the points standing out in every direction.
We have met Mr. H. F. W. Hoffman, clerk of J. P. H Wentworth, Indian Agent, on his retarn from Owen's River Reservation, with some women, fleeing, as we understand from the Indian troubles in that quarter.
13тe. Renfained all day at this camp.
14re. Started at 8 A . M. and about noon passed Maj. Gordon's Hotel, a commodious adobe house, formerly a sta tion on the Overland Stage Route. Stopped but a few mo, ments and passed on a couple $o^{\prime \prime}$ miles to camp. On our way up the Canon we were shown the narrow gulch wherea man and his famuly were caught, in the month of August last, by a water spout which overwhelmed the entire party drowned one woman and three oxen and completely wrecked every thing. The bones of the cattie were there as a lasting memorial of the sad wreck.
This Canon is about 25 miles in length, very gradually ascending nearly all the way, and the creek which runs through it crosses the road 92 times between Maj. Gor. don's and the mouth of the Canon, where it sinks, and come: up again about three miles out and then runs into the Sapta Clara.

We here met deer on the steep mountain sides and one of our party tried to bring one down with his rifle, but dic not succeed. A shot gun is a most desirable weapon or this trip, as with it, there is no occasion to want for fresh ganse.

15тв. Lelt camp near Gordos's, passed out of the Can on and in three hours reached Elizabeth Lake at 11 A .3 Here is good feed and plenty of water, so we camped arie stayed over night. At this point there is always a stif breeze blowing and generally very cold at all seasons. Wi were obliged to tie on our hats, and secure blankets arount us to keep any way comfortable, as the wind would blow on fire nearly out and when we piled on the wood which $F$. had packed from the Canon, it would blow the flame flat on the ground for 10 or fifteen feet. A most uncomfortabl place.

16 тн. Left Elizabeth Lake at 7 o'clock, passed ove quite a hill and came upon the great Mohave Dessert. Thi seems to be endless in extent, like a mighty ocean, lying mo tionless beyond the reach of vision, with a bright mountain rising occasionally from the plain, like islands. As I pass ed the summit, met a traveler on horseback, who told me h had seen a fresh grizly track in the road and I had bette keep a sharp look ont. I did so but had not the pleasure meeting his honer, and as I was not armed, did not con plain of the slight.
We passed on this desert, the cold wind and rain frol

## MINING AND SCIENTIFIC PRESS.

he mountains striking us on our backs for three hours, arved at Willow Springs about 2 p. y., stayed a couple of ours to rest and water the cattle, and at midnight camped Oak Creek. This is a beautiful stream of pure water ambling down the gulch, forming a good mill site every few ds, and plenty of oaks and pines on the hill sides and illows in the bottom. Ilere is good feed and plenty of it ? we remained till Sunday the 19 th, 2 p. M., when we toped out our wagon with good sweet hay at $\$ 40$ per ton, for te nse of the cattle from C'ane Springs, Ll Paso District, Slate Range, a distance of 60 miles and back. While Oak Creek parties came in from Owens River and reportthat all the Slate Rangers had left and gone in to Visa2, from fear of Indians, and also the Mivers from the Fil 480 District ; but we concluded to go through and take o chances. Druve on three hours and camped at the aink the Lechapa.
Apr. 20. Drove from 9 A. M. to 11 p. M., rested one hour Desert Springa, pushed on to Cane Springs, 33 miles om Oak Creek.
While passing over the Desert we frequently saw at a stance small heards of antelope, and the hare were as eaty as ever, but few quails.
At Desert Springs wo found the only house deserted, as - owner was too much out of health to remain while ose beyond him were hastening into the settlement.
21st. Started at 5 P. M. and arrived at Mesquit Springs 11. o'clock. This is the central location for the El Paso ines, which are now attracting so much attention. We und remaining here four or five hardy miners who had no ar about them, and who laughed at the idea of running ay from the Indians. They had all given Slate Rauge a fal and after a month or more of prospecting here had me to the conclusion, that this District had greatly the adintege over Slate Range in every respect. The motntains of full of metals, water is plenty, fuel within twenty-five iles and perhaps within fifteen, and supplies are obtained om Los $\Delta$ ngeles at about one half the time and labor and pout one half the cost.
22. The teams remaining here till toward night we ramed over the hlils, examining some of the rich leads, and peimens of others aud came to the conclusion that we buld take off our freight, stop here and prospect for the esent. So here we are settled and will report the condi-
on of things as soon as we get acquainted.
O. W. T.

A Grand Union Promenade Concert will be given the Temperance Societies of San Francisco, in aid of a. H. T. Sulfer, on Thursday Evening, June 11, 1863, a latt's Fall. Ticket, (admitting Gentleman and Lady,) ne Dollar.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable fineral deposits, other than gold, in almost every section of he State, which bave of late been made, it is but reasonao to suppose that prospecting even in California, has but st commenced. The simplest and most universal of all otaliferous deposits is gold. It rarely occurs in any other rm than that of "free gold" which is readily discernable to le naked eye. An examination of any rock or earth for oid is an extremely simple process. If its presence is susfected in alluvium, the simple washing of that alluvium in a arr is an invariable test. If in rock of any description; hal rock pounded fine in a mortar and washed, in the same hanner as alluvium, will usually expose its gold to the naed eye, if there is any there in paying quantity. The only xceptions, are where the gold is contained in iron pyrites, ropper pyrites containing also iron. In either of the wo latter cases the presence of gold may be readily ascer-
ained by placing the pyrites in any suitable vessel and leeping the contents at a moderate heat for from four to six ours, with frequent stirrings, by which means the sulphur fill be evaporated, and the copper, if any is present, changd to a dull red color, and the gold retaining its natural apearance, on subjecting the whole to the usual panning rocess, may be readily seen by the naked eye.
Not so with othermetals. Silver, copper, zinc, nickel,
and many others appear in sucli a great variety of metallifrous forms as generally to dufy all but the most practical and scientific eye. No description of these ores can be written which will afford any rery important nid to the jaexperienced in makiog explurations. After reading descriptious, however, and currefully examining the specimens ilescribed, the explorer may go out and search with some degree of coufidence and intelligence. A study of the characteristics of the sulphuret ores alone, wouk lead an explorer to pass over, entirely unnoticed, the moliest varieties of the ores known as Chlorides or Hurn Silver, which, from the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reasou to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.
Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquire a practical miverallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we herehy make the offer to miners, prospectors and all others, who in their travels or explorations may come acruss specimens having the appearance of rarity or value, to carefu'ly examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.
In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. Tne ordinary rocke with which the miner meets in his travels and Iabor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzoze nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a saries of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notica of the California prospector. These articles will be published under the bead of "The Miner's Laboratory," and will be found of great value to the mining public. [Mining and Scientific Press, April 20.

Subscribe.-Are you a miner and not a subscriber to the Mining and Scientific Press? If so, you are an annual loser of many times the price of \& year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a rolume of the Press, cannot be bought from the shelves of auy bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, sou cau find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars; or two dollars for six months, and become patrons of the only mining paper printed on the $\mathbf{P a}$ cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months ; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontue the paper after being a constant reador of it for even that short period.

THE ONLY MINING, MECHANICL AND SCIENTIEIO PAPER ON THIS CONTINENT.

## THIRD GEAR: VOLCAE YI.-NETV SERIES।

A new rolume of this extensively circulated pajer commenced Sept. 11,
1862. It is intended that every uumber shall be replete with information 1562. It is intended that every uumber shall be replete with infermation with several origiual engraviugs, of new inventious, etc., prepared explessly
for its columas. for its columans.
This paper is devoted to the nbove purposes, together with the interesto of Science, Arts, Agriculture and Commerce, and any genernl information
that may be of interest to the reader: and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and raluable informution to any paper yet published.

The Mining Interest!
Winl find it of great ralue, as it will contain all the news nppertaining to Mining, the prices and sales of bining stocks, new inventions of Machinery adap ed to tan
to the Miner.

## The Inventor !

Will and it an excellent medum for the purpose of bringing his invention
into uotice, of ascertaining the progress of 1 pention in this and other into cotice, of ascertaining the progress of 1 mrention in this and otber
countries, and also of receiring any information tint may be necessary in obtaining bis pateat, the proprietor having had great experjence as a Patent Agent, together with facilitios at Washington that enable him to ob ain Patevts with dlippatcls.

The Mechanic and Manufacturer !
Will be greatly bencfitted by its perusal, as cach number will contaun sera eral original engravings of new machines aud inventions, together rith y
large amount of reading matter appertainiug thereto. We are coustantlo large amount of reading matter apper ainug thereto. We are constantle
receiring the best scicntific journals from all quarters, from which wr shall continue to extract whatever may be of benefit or interost to oureaders.

To Chemists, Architects, Millurights and Farmers ! This journal will be invaluable. All new discoverics in Chemistry will be
given, and a large amount of information of great service to Arelntects apd
Millwrights will bo found io our columus. The Farmors aud Planters will not be neglected, engravings will be giron of agricultural impleaueuts, abd the farming intercst generally will be amply discussed. Terms.
To mall subscribers :-Four Dollars per annum, Club Ratea.
Five Copies for Six Months, $\$ 8$.
Ten Copies for Six Southe, $\$ 16$.
Tea Copies Cor Six Mouthr, \$16,
Ten Coplies for Twelvo Months, $\$ 30$.
Fifteen Copies for Twelve Montlis,
Twenty Copies for Twelve Montlis, $\$ 56$.
For all clubs of Twenty and over, the yearly subscription is only $\$ 280$ Specimen copies will be sent gratis to any part of the country.

THE MINERS' I.ABORATORY.-NO. VI:
HOTT TO PROVE TIE PRESENGE OF COPPER IN MINERALS AND

## other substances.

In order to proceed in a legitimate manner, to discover the presence of copper in mioerals and other matrixes, it is necessary that the miner should be made somewhat acquainted with the chemical tests for pure copper and in or der that he may be made so acquainted, we will set before him some few of the prominent ores and how to obtain them.
Dissolve about 1's oz of the sulphate of copper (blue ritriol) in about 6 oz . of water, divide the solation into six parts and proceed as follows:-

To No. 1, add a small quantity of the sulphide of ammoniam which will mmediately give you a black precipitate of the sulphide of copper.

To No. 2, add a solution of soda, which will immediately throw down the hydrated ox'de of copper in the form of a green powder, which will become black on boiling.
To No. 3, add a drop or two of the solution of ferrocyanid of polassium, this will give no precepitate but will give your solution a mahogany color.

T $\mathcal{N}$ No. 4, add ammonia in excess and you will obtain a very deep blue colored solution.

Iu No. 5 , place a strip of bright iron or zinc and a few drops of hydrocloric acid (muriatic acid) and the copper will be deposited in a metalic state on the iron or zinc.
It would be well that those prospec'ing for copper shou'd make themselves perfectly familiar with the above tests.

Having giveu you a few of the most reliable reactions of copper with reagents. I will now describe to gou how to prore the presence of copper in minerals, de. The substance to be examined for copper must in the first place be reduced to very fine powder and if insoluble in water must be dissolved, if green color in hydroch'oric acid, and if black or jellow in nitric acid. Vaporate the excess of acid after complete solution and dilute with 4 to 6 times its bulk of water and divide it into two parts. To No. 1, add ammonia in excess and you will obtain a deep blue solution, if copper is present. It is very probable the solution will be muddy at first-allow the solid matter to subside in order that you laay examine the solution.

In No. 2, you must place a strip of bright iron or zincif copper is present it will be deposited in the metalic state upon the zinc or copper. With these two tests, one confirming the other, you caunot fail to discover the presence of copper.
apparatts and chemicals requited for conducting tee above tests.
6 Glass Test Tubes.
1 Small Glass Funnel.
1 Spirit Iamp.
1 package of Filtering Paper.
1 \#. of Aumovia-1, Paper. Nitric Acid.
is. of Hydrochloric Acid-1 pint of Alcohol.
The value of the whole would not exceed $\$ 500$.
the comparatire talue of some of tee most convon of the ORES OF COPPER.
Native Copper generally occurs almost pure, and in almost every conceirable form, as massive, granular, filiform (thread like), arderescent, in thin lamina, etc. When found associated with other metals, such as silrer, for instance, the two metals usually occur in juxtaposition, simply, and not combined, a coudition which they readily assume when melted together in the crucible.

Sulphuret of copper is a very rich ore, fielding copper 76.5 ; Sulphur 23 ; and iron .5.

Red Oxide of Copper is a very rare and rich ore. Very little, so far as we hare learned, has yet been found in this State. When free from earthy impurities its yield is 88 @ 91 of copper, and $9 @ 12$ of oxygen.

The Black Oxide of Copper, in its pure state yields from 70 @ 80 per cent. of copper. Both the black and red oxide yields readily in the reducing flame of the the blow. pipe a globule of copper.

Fariegated Copper Ore (Teacock Ore) gives 50 @ 56 per cent. of copper, and promises to be quite common in the mines of this State.
Copper Glance, or Redruthite yields from 70 @ 79 per cent of copper, when quite pure, and in that condition may be readily melted in the ordinary flame of a candle.

It sometimes, though rarely, occurs in connection with Bismuth, when it falls as low as 18 to 20 per cent.
Antimonial Copper is ueither very common or rich. It sields 20 @ 25 per cent of copper.
Green Carbonate of Copper (Malachite) in its pure state contains 57 per cent of copper.
Blue Carbonate of Copper is usually a richer ore than the green and contains from 65 @ 70 per cent. of copper.
Gray Copper, is a very rich and promises to become a quite common ore, in this State. Its yield of copper is from 40 @ 50 per cent. This ore often contains as high as ten per cent. of silver, and sometimes a suall quantity of quicksilver.

- Copper Pyrites is the most abundant of the ores of cop. per and usually about the poorest. Its yield is greatly affected by the presence of iron and raries from 12 to 30 per cent-rarely, however, reaching 25 .
If $t m$ is ever found associated with Copperin California, it will probably be with this description of ore. When so foud it is usually in about the following proportions:Copper 30 ; tin 26 ; iron 14 ; sulphur 30.

INDICATIONS OF TIN PYRITES-ASSOCLATED WITH COPPER.
Tin Pyrites occurs massive, like copper ; its lustre is mètalic, with streak black; color from steel-gray to iron-black, sometimes presenting a blueish tarnish, with an uneven fracture. When heated in an open tube it gives off sulphurous fumes, with a slight sublimate of the oxide of tin. On charcoal, with the blow-pipe, the sulphur is first expelled, after which a dark scoriaceous (pertaining to dross, like the dross or scoria of metals) globule is obtained. The charcoal will also be coated with the oxide of tin. With so-
da, a globule of impure copper is obtained.
This species of pyrites may be more confidently looked for in a granite rather than a slate region. Copper miners will do well to keep a good lookout for this mineral, as, if found it will be a valu uble ore.
Arsenical Copper (Domeykite) which may be known by its reniform and botryoidal appearance, (reniform, having the shape or form of kidneys; botryoidul, shaped like a bunch of grapes) is a very rich, though somewhat rare, ore. It yields, when pure, about 70 per cent. of copper, and 30 of arseuic. Its composition sometimes varies eo as to bring the copper as low as 60 , with arsenic 20 , and 20 parts of iron and sulphur.
Sulphate of Copper yieldsabout 25 per cent. of metal, and occurs irregular in shape and in three-sided crystals, with a glossy lustre, approaching to sky-blue, in lustre. I'his mineral is often found dissolved in the water which issues from the miue. The copper from these waters is obtained by precipitation with iron. At a mine in Wicklow, 500 tons of iron were laid at one time, in the pits into which the water was collected, and in about twolve months, this iron was all decomposed or disolved, and each ton of iron was found to have deposited two and $a$ half tons of a redulish mud, which was an oxide of copper, and which upon proper treatment yielded 16 cwt of pure copper to each ton of oxide.

Copper Ore.-The Steamer Panama, which arrived here from the North last week, brought down several tons of very rich ore from the Dol Norte Copper region. The Mammoth Company sent a quantity of sulphurets of extraordinary richness. The Eroca sent about 100 bags of rich oxides. The Mines of the Del Norte region are being rapidly developed, and are promising to be exceeding rich in both quality and quantity of ore.
At last reports there were some 500 tons of copper at Stockton, on its way to this city for shipment East. This ore is from the Napoleon, Union, Keystone and other mines in Calareras. The amount of copper ore now com. ing formard is beginning to be quite important-although but a small portion of that which is being raised.

Lake Bigler.-This beautiful sheet of water covers an area of about 300 square miles, and is 6,000 feet above the level of the sea. It is engulfed between two ridges of mountains which form on either side some of the highest peaks of the Sierras. The central portion of thrs lake has recently beer sounded to the depth of 2,400 without finding bottom.

## NEW MAP OF THE UNITED STATES.

We have now hanging up in our office the most accurate and complete Map of the United States, which has ever been published. In size it is about 40 by 50 inches, and contains the naves of 300,000 Towns and 31,000 Railroad Stations, all distinctly lettered. Every Railroad in the United States and the Canadas, with every Station estab. lished prior to June 1862, is clearly and distinctly laid down on this Map, as well as all the principal Rivers, Fortifice. tions, Battlegrounds, etc., up to the above date. The Map is divided off aud colored in Counties, and has been prepared at great cost from actual surveys. The Maps prepared by Mr. Lloyd, are used by the Officers of the Army and Navy everywhere, throughout the Union lines, under the sanction of the Secretaries of War and the Navy. So confident are the publishers of its accuracy that the Map bears upon its face the following note, distinctly printed in large type :-"Any one finding an error in this Map will be entiftled to a copy, gratis, by writing to the publisher." The Map is sold only loy Canvassers. An Agent is now canvassing the City for its sale. No Dwelling, Office, or Counting. Room should be without a copy This Map is published by J.T. Lloyd, and should not be confounded with an inferior publication by H. H. Lroyd.

Prospecting Machivery.-Quartz Miners and Prospectors at the mines, desirous of having their ores practically tested in this city, can have every facility for doing so by forwarding them to Mr. Williams' Reduction Works, near the Miners' Foundry, at 261 First Street. Mr. Williams has several machines in operation at his establishment, among which are Pond's Crusher, Kimball \& Ellis' Stamp Mill, Howland's Grinder for Quartz Tailings, etc. The quartz thus reduced can be carefully amalgamated in Wheeler's Pans, or by other processes, as may be desired.

## WHEELER'S Amalgamating and Separating Pans.

It is acknowledged by all who hare examined the principles and withessed the operation of these Prans, that they are decidedly superior for trituratiog and amalga. The most important principle connec
The mast important principle connected with the ope-
ration of these Pans is the seraration of the trituratiug process from that of extracting the amalgam from the sand. The chief cause of luss of the precious metals ari-
ses from the passing off of the same io combiuation with the quiclssilver, during the proces of trituration, and in cleaning up. By the introdtction of the Separatigg Pau
to follow the trituration this ioss is entirely avoided. In working these machincs there is no appreciable loss o guicksiver, and hence nove of the precions metals.
There these Pans buze been introduced aud operated
ov the side of others tin sands from the same rat, the ov the side of others cin sands fron the same rat, the Thecler Pans hare unforinly gained a large perccotage
nf metals over its competitors, as well as a still larger nf netals over its competitors, as well as a
parcentage in the ameunt of work performed.
*** These Pans man be seen in dails operation, at the Miner's Foundry, on First street in this cits, where al nosb-tf

FIEERY DESCRIPTION OF IRON AND BRASS MAC in the state of Cationdin, will be furbished with , patch at the Miners' Foundry and Machine Wortis, 88 Steam Eugines and Boitere, Flower, Saw and Qua mill machivery, Mining Pumps, Amalgamators, Retol
Etc.,
Sic.,
Particular aftention will bo given to the manufact of Machinery in Sectiona, designed for piaces of difth access, Tarious models of QuartzCrushers, Amate
tor's and Water Wheels-Some in operation and on bition. Partles desiring to test their ores practically, small quantities will be afforded ample facilities, fr
cost. cost.
All partics desiring accurate and highly fnished din inge and Superior Machjnery, at most reasocahle
are cordially iurited to call before contracting elsewh HOWI.AND, ANGEL \& KIN
Salf Francisco, February 23,1663 .

The accompanying cut represents the A malganator invented by Mr. Thos. Varin of this city. The inventor resided n Virginia City from Nov. 1860 to Dec. 861. Huring that time the ext acting fretals from th ir ores, particularly ilver, having become a matter of deep nterest to many, he was led to examiue he nuchinery in general use for amalgamating, and becaus convinced that it could be improved. From that tinue to the present he las devoted his time and attention entirely to this subject.
His theory is, that to extract the precious metals from their ores, particularly Iver, the ores must be reduced very Ane-that ores will continue to yield metal as long as the particles can bo reduced n size and that no process can extract he metal by umalgamation until the ore a made fine.
Further, that the particles of metal as soon as liberated, should at once be prought in intimate coutact with quicki) ver ; hence he deems it necessary to oulverize the ores in the presence of quick ilver, but the machinery should be so ponstructed as to grind the quicksilver as little as possible
Furthermore that the apparatus heretofore in use has been too slow in its operation, making too much machinry uecessary.
Like most valuable inventions, this machine has passed h.ough a regular series of improvements, from its commencement to the one above illustrated. It seems to us hat this A malganator is a very great improvement on maphinery heretofore in use, and the great demand for them goes to show that others think as we do.
To explain the operation of this invention we copy from he specifications in the patent granted Dec. 16, 1862.
"This inveution consists in the employment or use of a rotary and stationary muller placed within a suitable pan or fub, provided with a cover and arranged in such a manner that when the device is in operation the ore will puss in a current or stream ontward frow the centre, and butween the mullers to the circumference of the same and thence onward over the upper rotary muller to the centre of the same, and
 ary one, to be again thrown to the periphery of the mul lers; thereby causing all the particles to be brought in contact with the quieksilver, \&ec."

This invention also consists in the employment or use of curved or spiral scrapers, placed within the pan or tub, and arranged relatively with the upper surface of the rotary muller, in such a manner as to insure the passage or move ment of all heavy substances in the pulp, along with the current, \&e."
The machine which we llustrated in this paper some time since, called "Wheeler"s Amalgamator," is in principle and and mode of operating, similar to the above. $\Lambda$ suit is now pending' in the U. S. Circuit Court, between Mr. Varnex

Effect of Phessure on Hilegrrn-conprerring Ponver. - M. Jilie Wartmann has found experimentally that the electric conductibility of copper wire is s*nsibly diminished by a pre sure of 50 atmospheres, that this dimunition increases with the pressure, and disap pears who o the pressure is relieved. The experiments were carried un to 400 atmospheres. These reaults es ablish a new analogy between heat light, and efectricity.

Ture Enterprise Gold \& Silver Mining Company recently filed the $r$ certificate of Incorporation, with a capital stock of $\$ 100,000$, in 1000 shares of $\$ 100$ each. C. A. Jamee, President ; Rodney Clark, Secretary. The mine of this Cmpany is located in the Colorado District, Mexico.

Plumbago.-The Tone Copper Mining Co., at a depth of about 35 feet, have struck black lead, about two teet wide, said to be of an excellent quality.

The coinage of the United Statos Mint, of this city, for the month of May emounted to $\$ 2,206,000$.
and Mr. Wheceer and others for infringement. These Machines work 1000 toss, at a batch, and will complete three tons in twenty-four hours. They are manufactured by Donayue, Booth \& Co., at the Union FounDRY in this city, and the workmanship is superior to anything we have seen in Amalgamating Machinery.

Tons of Bullion.-According to the Territorial Enter prise, the daily shipment of bullion from Nevada Territory, at this time, is teo tons. Two tots of bullion, as it comes from the Washoe nines, is worth about $\$ 125.000$; and that amount per day would give three and a quater millions per moasth, or $\$ 39,000,000$ a year. 'These are pretty large figures; but perhaps the present shipments ure being made from a surplus of past accumulations, which will soon become exlausted and so let down the yield, in a short time. to a reasouable figure-say one million per month. Washoe will be entitled to all the credit in mineral productiveness, that any similar extent of population need ask for, if she will only come up to the latter figure during the ensuing tivelve months.

War Risks.-The increasing depredations upon our commerce by the English-confederate pirates, has had the ?effect to materially increase the charge for war risks upon vessels passing from the Eastern States or Europe to California. The war risk has besn cradualy advanced, until it has now reached 10 per cent., which, with the ordinary charge of 21 , (a) 3 per cent., makes a very heavy tax an general merchandise seehing a market in this State.

The Gipson Quartz Mill, in Tuolumne county, turned out ,5000 week befure last.

Revenue Tax Upon Procucts of Iron Foundries.-
The Dommissioner of Internal Revenue has made the following decisions with reference to taxes imposed on various products of iron.
1.st. All steam engines, whether marine, locomotive or stationary, are subject to a duty of three per cent ad volorem. 2d Cast iron shafting is liable in all cases to a apecific duty of one dollar and fifty cents per ton, under the act of March 3d, 1863. Wrought iron shafting, if held to be manufactured within the meaninig of division No. 71, is liable to a tax of three percent ad valorem.
3d. Railroad car-whoels are taxable in all cases, one dollar and fifty cents per ton. All other castings ofiron exceeding ten lbs in weight, not otherwisp provided for, are taxed one dollar and fifty cents per ton, by act of March 31st, 1863.
4th. Castings of all description made exclusively for instruments, articles or machinery upon which duties are assessed and paid, are exempt from duty under section second, act of March 3d, 1863.
5th. Castings notexceeding ten pounds in weight, which are so well known and so generslly used as to have a commercial value in themselves, are taxable three per cent ad valorem, when not otherwise provided for.
No Draft in Cahifornia.-The draft will soon be enforced in the Fast, but it is stated that there will be no draft. ordered in Califurnia, unless a foreign war or an important demonstration on our lower borders should make it necessary to raise toops here.
Remoral. - Mr. Wm. Shiels has removed his office from its former location on Merchant Street, to 309 Bush Street. Mr. S. is largely interested in the Copper interest.

## THE MINERS' I,ABORATORY.-NO. VII.

METALLIFEROUS TREATMENT OF PYRITES
No mining district in the world, probably, is more prolific of Pyrituous ores than the State of California and the adjoining Territory of Nevada. The treatment of Pyrites, for the metals of gold and sulver is one of the most difficult of metallurgical processes, and one in which but few have succeeded. Perhaps no one on the Pacific Coast has been more successful than Mr. Deeteen, at his works near this city, on the San Bruno road. Millions of dollars have, without doubt, been allowed to pass away in the auriferous pyrites contained in the tailings of our quartz mills, which have been allowed to run down the creeks and ravines near which the mills are usually placed. The treatment of these stubborn ores is a matter involving great chemical skill, and has been made the subject of much study and experiment. Hence any sugge.tions on this subject coming from sources of acknowledged skill and experience, are ever deemed valuable. Mr. Deetken's process is known as the "Hydrechloric process, and his modus operandi was fully described by our predecessor in this paper, about one year ago. We have long intended to visit this establishment and again speak more fully of it, and shall endeavor to do so soon.

In the concluding portion of this article we have alluded to "Keiths Desulphurizing Process," which was fully described in our issue of the 2 nd of March last. Our presen purpose is to lay before our readers the ideas of a pructical Metallngist of Washoe, upon this subject, as communicat ed to the Washoe Times, from which we quote.
"The necessity for the sulphurated ores being reduced to a powder as fine as flour, must be self-apparent to every one as it is connected and combined with two of the most subtle matters known, sulphur and arsenic, both of which, we will hereafter show how they may be effectually discharged without loss to the valuable contents of the ore. It being the Tact that these two substances pervade the whole body
of the ore, it is clearly evident that the ore must be reduced of the ore, it is clearly evident that the ore must be reduced
to the finest powder, ere their enemies can be attacked with a certainty of overcoming them. To effect this, the ore should, after it leaves the stamps, pass through a series of sieves, say three in number. These can be very inexpensively arranged, in a case or housing lined with sheet zinc, which will prevent any of the material from escaping, and entirely preclade any annoyance to the parties engaged in the reduction works. These sietes should be so arranged that the coarser parts of the ore shall be deposited in a chamber for their reception, is order that they may be recru-hed, and the finest-reeeived in a bin by itself.
As stamps appear to be the asual mode adopted in this country for crushing the ore, we have treated of their use first; but the best method of crushing these ores, is $b$ crushing mill, composed of three pair of cast rollers, with chilled faces, which are easily renewed, and with the sieves attached. By this method the ore is reduced to the finest powder, as none but that fit for use comes down ; the coarser particles, that will not pass through the sieves, being carried back to the upper hopper of the mill without any manual labor, and without the smallest loss either of power or material. This wethod requires little or no attention, and thereby saves much expensive labor. We will assume that there is a bin filled with finely powdered ore. Now, let us examine what we have in this compound. Here is iron in arsenicated sulphuret, arsenic in the mass, as well as in as-
sociation with the iron, salphur admixed with all the matesociation with the iron, salphur admixed with all the material, and silver diffused in the same manner in particles as
fine as the sulphur itself. The first ingredient to be attacked is the iron, which we have shown is an arsenicated pyrites. Having this matter in a highly-pulverised state,
there is no difficulty in altering its whole chemical feature, there is no diffculty in altering its whole chemical feature,
by converting it into an oxyd. This is not a very costly process, the reagents fur accomplishing which would not cost in this councry, more than five dollars for a ton of ore. This process requires a few days, according to the amount of iron that the ore contains. The whole material will now be in color, from a slate gray to a light reddish brown. In this state the iron will give forth any of the precious metals that may be held in combiuation. Having subjugated
enemy number one, we now attack the combined antagonisenemy number one, we now attack the combined antagonis-
tics of arsenic and sulphur This is effected by placing the oxydized material into a large wooden vessel called a desulphurizer, having first adınixed with it the reagents that will cause it to give forth both the deleterious materials with
which it is charged. 'The cest of these reagents would be which it is charged. 'The cest of these reagents would be
from three to four dollars to the ton of ore. Each desulphurizer should hold from one to two tons of ore, or they may be made larger should it be required. This wooden ressel is made steam tight, and is filled by a run hole on the top. To it is attached two or three pipes, with cocks, by which steam is admitted, aud the whole mass is kept in motion by the means of wooden arms, attached to a shaft of the same material, which is moved slowly by any power that the works
may have adapted. By this method the reagents are ad ${ }^{-}$ mixed through the most minate portions of the ore. On the top of the vessel is tixed an iron gun-barrel pipe, in which is a stop-cock, which is kept closed at the cominencement of the proness, but opened gradually as the heat advances. The desulphurizer is nerer filled to repletion; therefore the space unoccupied by the ore is filled with sulphurated arsenicated hydrogen, which is allowod to pass off through the gan barrel pipe, which should be long enough to carry off the rapor to some distance from the works, as the flour of arsenic will fall in coming in contact with the air; or, a safer
plan is to carry the pipe, with an inverted discharge, into a a tank of water placed sufficiently high to receive it. This tank mus! be used for no other purpose; the flower of arsenic will be precipitated there, and no deleterious effects will be communicated to the air. This process of removing these two ingredients will occupy from two hours and a half, according to the amount of sulphur, arsenic and sulphurous acid that the ore contains. The appliances to effect this object are also inexpensive in their character. even in this comintry. This simple method of desulphurization precludes the necessity of using either the roasting or reverberatory furnaces; it does the work required with more ease, and more effectually and mnch more econonomically,
and without any liss of the valuable contents, and also without any annoyance to the men employed - as there is n dust or pernicious vapors thrown off in the buildings-and the labor is lessened by two-thirds, as one man can well attend to three vessels; added to which there is no loss of a portion of the metalic contents of the ore, as in the use of the reverberatory furnace, in the use of which-the ore be-
ing a sulphuret and brought in contact with the fire-the combustion that takes place in working the ore, causes the gaseous portions to be given off as a sulphurated, arsenical hydrogen gas, and combnstion carries with it a portion of the silver. This can easily be proved, by placing a nicee of silver in a covered crucible with some powdered sulphur and arsenic, and placing the same in a white heat for half or three-quarters of an hour and then removing the cover of the crucible; when, immediately, the oxysen of the air comes in contact with the contents and a brownish vapor will commence to ascend, and, if allowed to remain in the fire a few minates, on removal, the silver will be found to have been volatalized and passed off iu gaseous vapor.

> J. B. 'Truckee.

In a subsequent communication to the \%ime, "J. B. Truck-
ev writes as follows in allnsion to the "Keith Process":
"The method of the reduction of the ore to a fine powder by the means of a hollow dram, with the edge runner fan in side, I have no doubt is a very efficacions and quick method of bringing the matrix to the pulverescent state in which it is uniformly required, and which is a very primary desideratrm, and one to which too much attention cannot be paid. * * * I am of opinion that the desulphurizing process is not so good as the one which I mentioned in an article in your Journal ef March 'th [The article here referred to is the one we have copied above-Ed. Press.] and for several reasons:-
First, the use of fire in the operation of desulphurization must be attended with some loss of the valuable contents of the ore, which is an arsenerated sulphuret, by the fact that the heated ore, most, in throwing off its sulphur and other deleterious matter, ini a gaseous form, and in contact with the oxygen of the heated air, carry with it a portion of the sulphuret of the silver contained in the ore. which mast be evolved and pass off. thereby making a serious discount on the percentage of yield in the results. This loss will be nec essarily increased according to the larger amonut of sulphur etc. contained in the ore. In fact, this plan is open to the same objections, as the use of the reverbatory frornace, and must secondy, be far more expensive than the simple meth
od spoken of in the paper above referred to. By the use and admission of steam to the vessels there described, and the perfect manser of the admisture of the simple rearents, the desulpharizing is effected at the least possible expense, and in the quickest possible time, in the most effications manner, and without the possibility of the smallest loss of the valuyble contents of the ore, from the deprivation of any of its valuable contents. I do not wish to be thought egntistical in my views of this subject, as I have no patent for this simple process, but merely introdnce it in purpose of showing how easily the most subtle papers, for the parpose of showing how easily the most subtie coes the the dued and entirely dispelled."

## THE " KEITH PROCESS."

A correspondent of the Washoe Times appears to be very desirous to learn something about the cost, etc., of the machinery employed at the Pike's Peak Mines for reducing quartz in connection with what is known as the. "Keith Process," remarking that "It would be of great general benefit could the inventor (Mr. Keith) furnish us with some daa as to the cost of the e drums, and copies of the drawings or lithographed plans of the invention, and the amount, of oyalties that he would require for that portion which patented."

The machine referred to is a Rotary Crusher, known, we believe, at Pike's Peak, as the "Young America Crusher:" The method of reduction is by the rapid revolution, in a hollow drum, of a set of arms or beaters. T'hese arms are made to revolve, $i$ we mistake not, at the rate of ten or twelve hundred rotations a minute. The quarta being thrown into the machine through a hopper, is instantly reduced to a powder by the rapidity of these beaters, and forced out in a very fine dust by the current of air provided by the rapid motion.
This machine can be obtained at the Golden State Foundry in this city. Messrs. Palner, Hanscom \& Co., the proprietors, have already constructed several of these machines, for a Mrxican Company, under the direction of Mr.
Leeds, who has used it in the Atlantic States. The cost of Leeds, who has used it in the Atlantic States. The cost of
the machine is about $\$ 300$, and it will weigh, all ready to run, about 1300 ths.
The use of this "pulveriser," as it may properly be termed, equires a first breaking up of the quartz into very firie fragments. Say to the size of hazlenuts. The best maschinery to accomplish this portion of the work, with which wo are acquainted, is "Blake's Stone Breaker." This machine has a world-wide reputation as an efficient and relinble agent for the reduction of rock of any kind to small fragmenta, such as are required for macadamizing roads, manufacturing concrete, etc. It is also very generally used by iron ore smelters in Pennsylvania, and Missouri, for reducing their ores-the hardest in the world - to a proper size for smelting. These machines are constructed of different sizes. One which will crush, say one and a-half tons of quartz per hour, will weigh, with frame all complete for running, about 6000 ths-the castings alone will weigh 4000 , and will require a six-horse power to drive it. Machines are made of five graduating sizes up to twice the capacity of the orie above described which is the smallest made. The machine is so constrncted that it can be driven by any power less
than that required for its full working, down to two-horse power, the product of the machine, being simply reduced in like proportion. One of these machines may be seen in almost constant operation at the foot of Market St., in this city.

We fully agree, with the correspondent above alluded to, in hisopinion of the "Keith Process." This correspondent, by the way, is evidently one of eminent practical and scientific attainments, in every department of mining. He has been for some months writing a series of very valuable metallurgical articles for the Washoe Times, over the syguature of "J. B. Trocker." We quote the conclusion of his letter, already referred to :-
"1 should certainly feel much obliged for more information on the sabject of Mr. Keith's simple crushing mill for pulverizing the ore, as I have no donbt that it is a vast in provement upon the ponderous stamping process, of which I am no admirer, for I prefer the crushing mill. Mr. K eith's
method appears to be more efficacious, as well as more expedicious in its work, for it appears to reduce the ores to the finest powder without the aid of sieves, which are requirad in the ordinary crushing mill. His invention requires to he well thought upon by all parties interested in the reduction of the ores of this conntry, as, if it can perform what is stated of it, a vastamount of power of reduction will be
tanced by every mill throughout the Territory; and t tanned by every mill throughout the Territory ;
same amount of propulsion used in a stamping most certainly produce nearly double the results and if the ore is turned out in the state described, it is in a much bet ter condition for giving forth its contents than nine out ten mills are capable of reducing it to. It must be clear that the extreme rotative momentum of the fan in the dram
must be next to irresistible by any substance coming in contact therewith.

Mono County was organized a little more than one year ago. It is a long, narrow strip, extending in length from Walker's River to the 37 th parallel South, a distance of about 150 miles. In breadth it extends from 20 to 60 miles. Mono Lake is in the center, and Owen River waters a considerable part of the central and southern portions.

Death of an Editor--Datid Wentworte, Editor of the Oroville Union, died on the 27th ult., of congestion : the brain, aged 34 years. Mr. W. came to this State i 1860; has resided in Oroville since August last, at which time he engaged in the publication of the Union. He
leaves a wife and child in the East. He was a relative o Mrs. Sigourney, the Poetess.

## MINING AND SCIENTIFIC PRESS.

## REMOVING:SCALE FROM BOILERS.

A series of important experiments have recently heen oried unt at I'ortsmouth un hoard Iter Majesty's paddin faner Wallaco, under the sup rision of Mr. G. Mardock, divetor of machinery afioat at that port. The object nght to be at ained, is the removal of the scale generated the surface of steam boilers and their tabes, by other and jre expedicinus means than 'hy the present system of manI labor. The importance of the suliject will be fully comehonded by all who may be in the slightest d. gree converbo with sleam machinery. Under the present system ould a ship's builer require cleaning out, or cleaving from ale, while on board the ship, all the boiler doors have to taken off and a number of men sent into the boilers to an the scale by manud lubor. By these greans, with the eateat oxertions and any amount of time, possibly 10 per nt. of the scale inight be removed, and with this small imfrement the engineer well knows the reliet he finds in tiug steam. By the system which has now been undering so long a series of tests on board the Wallace, only e tuor of the builer has to be taken off to allow the in duction of the steam pipe. The boiler to be acted upon then filled rapidly wilh superheated steam at a temperafo ef $4010^{\circ}$ of heat; this actiug upon the saline deposits the surface of the hubes, and other parts of the b ifler, ex nds and disengaged it from the several parts. After this boiler is again filled with water, and steam got up in usual manner, and kept up for a few hrurs, and on afwards blowing off the boilers, they are found to be as from scale as when they were first put on board the ship. e experiments have been highly successful. 'The saving fuel alone in our steam ships of war from adapting this In to their boilers, will be very considerable, and the dele scale may be removed from a ship's boilers in 12

A very remarkable specimen of scale may be seen the chemical laboratory in Portsmouth Dockyard, which sa removed from the boilers of Her Majesty's ship Sidon en under the command of Sir Charles Napier. The impssion of the tubes on the scale is perfect.

Batance Rolling Bridges.-Mesers. Turner and Gibson the Hammersmith Works, Dublin, have invented balance ing bridges, of a very simple and convenient construction, Wich are easily worked' and especially adapted fur crossing $k$ entrances, canals, \&c. The bridges have aiso been erec, and fonnd to answer admiradly for ordinary traffic and railroads.

Amertcan Silafr in Canada.-A letter from Toronto mada, says that it is estimated that there are 30 tons of hercan silver in circulation, or rather heaped up, in T'oto, London and Hamilton. Merchants take it only at 5 l cent discout.

## TO MINERS AND PROSPECTORS.

In view of the frequent accidental discoveries of valuable reeral deposits, other than gold, in almost every section of State, which have of late been made, it is but reasonato suppose that prospecting even in California, has but themmenced. The simplest and most universal of all taliferous deposits is gold. It rarely occurs in any other sin than that of "free gold" which is reudily discernable to naked eye. An examination of any rock or earth for ad is an extremely simple process. If its preseuce is susfted in alluvium, the simple washing of that alluvium in a If is an invariable test. If in rock of any description; hner as alluvium, will usually expose its gold to the naId eye, if there 18 any there in paying quantity. The only coptions, are where the gold is contained in iron pyrites, copper pyrites containing also iron. In either of the fo latter cases the presence of gold may be readily ascerned by placing the pyrites in any suitable vessel and 1) ping the contents at a moderate heat for from four to six furs, with frequent stirrings, by which means the sulphur I be evaporated, and the copper, if any is present, changto a dull red color, and the gold retaining its natural aparance, on subjecting the whole to the usual panning pcess, may be readily seen by the naked eye.
Not so with other metals. Silver, copper, zinc, nickel,
and many others appear in such a great variety of metalliferous lorms ae generally to defy ull hut the most practical ant seientific ege. No description of these ores can be written which will aflord any very important aid to the int experienced in making explorations. Altur reading descriptions, however, and crurefully e.camining the specimens described, the explorer may go out and search with some degree of confidences and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explurer to pass over, entirely unnoticed, the rehest varieties of the ores known as Chlorides or Hurn Silver, which, frum the facility with which they may be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic re gions of this sitate. So with many other ores.

Considering the great difficulty, in the present lack of cabinet collections, and ather means of iustruction, to acquire a practicul minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our ninural resources, we hereby make the offer to $m$ 'ners, prospectors and all others, who in their travels or explorations may come acruss specimens having the appearance of rarity or value, to carefully examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. Wa have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be presented to us.
In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. The ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral walue are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarcely a piece of quartz or rock of a quartzoze nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found apon or near a vein of quartz it should be carefully examined "in place." and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "The Miner's Laboratory," and will be found of great value to the mining public. [Mining and Scientific Press, April 20.

Subsoribe.-A Are you a miner and not a subseriber to the Mining and Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanies, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no papfr that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and vecome patrons of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their suhscrilsing for it at once. It is not our usnal eustom to receive a subscriber for less than six months ; but inasmuch as we are ansious to introduce the paper where it is not now known, we will, for the present, send the Priss for three months even. on the recelpt of one dollar, in coin or stawps. It is our belief that no one will wish to discontue the paper after being a constant readәг of it for even that short period.

## MINING AND SClENTIFIC PRESS.

THE ONLX MINING, MECHANICL AND SCIENTIEIC PAPER ON THIS CONTINENT.
TIMRD YEAR: VOLUAE NI.-NEW EERIES:
A uew volume of this extensirely circulated paỵer commenced Sent. 11,
1862. It is intrnded that every number shall be replete with information 1862. It is intended that every number shall be replete with information
concerning Miniug, scientife, Meehanical and Induatrial pursuits, together with several origimal engraviuge, of new juventious, etc., prepared expressly for its columins.
This japor is devoted to the above purposen, together with tbe interesta of science, Arts, Agriculture and Commerce, and any general joformation
that may bo of interest to the reader : und it is the intention of the proprio tor to spare no paius or expense in making it equal in interest and valuable laformation to any paper yot puhlished.

## The Mining Interest !

Will find it of grant value, as it will contrin all the news anpertaining to Mining, the prices and sales of Mining Stocks, bew inventions of Mackinery
aditperl to that purposo, and of everything generally that may be of servic to the Miner.

## The Inventor !

Will find it an excellent mediam for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other
countries, and alno of receiving any information that may bo necessary in obtuining his patent, the preprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to ob ain Patents with dispatch.

## The Mechanic and Manufacturer !

Will be greatly beneftted by its peruanl, as cach number will contam sevs eral oricimal engravings of new machines ado inventions, together with lacge amount of reading matter apperlaining thereto. We are constict ahall coutinue to extract whatever maty be of beneft or intorest to ou

To Chemists, Archiiects, Millwrights and Farmers ! This jourtal will be invaluable. All new discoveries in Chemistry will be given, and $n$ largo tumonit of information of great sorvice to Arclitects and
Millwrights will be found in our columus. The Farmers and Planters will not be neglected, engravings will be given of agricntitural implements, and the farming interest generally will be amply discussed.

$\$ 116-4-11$ ths cents. per standard ounce, $1 / 2$ per ct. gross value of silver for making bars; also when gold is contained $1 / 2$ perct. on gross value of gold for coining. Refining charges as in purchases.

Bars Sold From Refinery.
$\$ 121 \mathrm{cts}$ per standard oz. 1 你 per ct. gross value to be ad ped for making bars.

Deposited for Dollars.
\$16-4-1lths. per standard oz. $1 / 2$ per ct. gross value for oining, when gold is contained, refining charge the same as in purchases

Deposited for Tmported Bars.
$\$ 116-4-11$ ths. cents per standard oz. $1 / 2$ per ct. gross value of deposit for makivg bars.

## SƯPPORT YOUR MINING PAPER.

The Minting and Sicientific Press is the only mining paper in California, and the only medium through which our miners can derive, to any extent, that practical infurmation in relation to their difficult and hazardous calling, which is so esseutial to an intelligent and successful prosicution of their bnsiness. Small as is the morlicum of information we have yet been able to give, we have frequeutly had the satisfaction of peranal assurance from our mining readers, that they have often been benefitted by one or two numbers only, more than they could possibly have been by a full year's subscription expended in the purchase of any book or book in the State. We intend to embody in the papers under the head of "Miners' Laboratory," all the pullished information saluable to muers, and all that can be obtained orally or in manuscript, from such intelligent mivers and mining writers with whom we may meet or correspond. Of course, we do not expect to exhaist the subject in one, two, three or four yearis. Mining, like all other industrial callings, is progressive, atd almost every day is developing new facts, in some quarter, which it is desirable should ve laid at once before the mining pablic. This office it is our aim to perform. in addition to collectiug and pl cing before them all standard information. The present is most emphaticully an age of progress, and no one can hope to excel $r$ succeed even, in any occupation, without being kept constantly pested in the current improvements in relation thereto.

California, is now upon the mere threshold of mining. Our labors, thus far hare been like mere pin scratches upon a school boy's globe.

In years to come, and in few years and short, compared to mining progress in other parts of the world, we shall be burrowing deep, thousands of fathoms deep, into the bowels of the earth. Then other knowledge than that $r$ latiug to mere surface workings and surface indications will be needed. So long as we continue to manage this paper, we shall endeavor to time our articles devoted to mining instruction. to the most urgent necessities for the time being. We are now in the midst of a "Copper Excitement," and for the past few weeks we have heen endeavor ug to throw out a few practical hints which shall be most adrantageous to our copper hun!ers. If any think we have failed to give important information on this point, let them invest $\widehat{5} 50$ in the most judicious manuer possible, for books treating upon this subject, and see how much information they will get for their $\$ 50$, on the ground which we have traveled over; over and above what we have given them for one dollar in in the Mining Press.

We shall for the present drop the "mineralogy of copper," and devote a tew numbers to the various processes of separation and concentration which the ores of copper require, to prepare them for a market or for the furnace.

We shall take up Silver, after we have done with Copper. as our next and perhaps most important subject for examination.
As we stated in the outset. the Mining and Scientific Prese, is the only paper in California, and in fact, on the Continent, which is expecially devoted to the mining inter-est-particularly with the view of collecting, collating and imparting valuable information to the working miner. Other papers of our City and State devote a liberal share of their columns to general, local and topographical information with reference to the mines, and to some extent keep up a record of their progressive advancement. That class of information, however, is valuable only to the general reader, or to the miner, so far as it may aid him in seiling his slocks; but it is of no possible advantage tn the working miuer. as an aid in the difficult and, to most in this State, untried calling of developing our mines or seeking' oat new ones.

True, we are devoting but a small space to this class of information, from the fact that in a journal of this kind it is necessary to give variety to its columns; but with an enlarged sheet, such as we propose, we shall be able to do full justice to this important development. As yet we have been able to issue a shert of only very moderate proportions. But we commenced with nothing, aye worse than nothing, as we have been compelled to overcome a most deep seated antipathy against our predecessor, which has cost us far more labor and money than an entirely new eyerprise would have done. This antipathy, we believe, has
been pretty much overcome, and we have good reasons for thinki.g that all who are nuw duing business with this office are perfectly satisfied with the manner in which our busi-ue-s is transacted.
Our enterprise, commencing as we have already said from nothing or worse, has gradually advanced until it is now self sustaining-at least upon its present basis. But sti 1 we are not satistied. We wish to double the s ze of our sheet, and trebble the amount of readiug matter. With such a paper we feel confident that we could be of vast serrice to the mining interest of the Pacific Coast, and, by the information which we could collect and disseminate, add largely to the general advancement and prosperity of the entire mining interest, to say nothing of the character, and additional importance which such a sheet would give to our great leading interest abroad. But printers will not work for nothing, and paper dealers, at the present time especially, come in fur a la'ge percentare of newspaper receipts.
True, onr patronage is increasing weekly and daily. Sub scribers are coming in from all parts of the State as we'l as from the city. Advertisers are also begiuning to find that the Mining Pressina valuable medium for introducing them to the public-esp cially those tran-acting business with the mines ir who are engaged in mechanical pursuits, and we take this opportanity to thank our friends, who have interested themselves in our behalf, for their efforts.
Prhaps we ought to be content to creep a while longer, but we much prefer to be taking manly strides, and to occupy a position commensurate with the interest, which we represent. This we might very soon accomplish, and double the size and usefulness of our sheet, if those in this City directly engaged in mining operations, would bestow upon us but a moiety of that patrunage belonging to us, but which is now scattered in varius directions and given to those jour nals whose only tendency in the direction of mining, is to foist upon the public, speculative operations, without imparting any practical information which shall be of value in the actual development of our mines. Our city circulation has now reached an extent and character, which renders our columns a desirable and appropriate medium for "mining notices" of every description-particularly notices of meetings, sales of stocks, se. Weekly insertions of such notices, as a general rule, are all that are requisite or of any benefit to the Companies. And the fee for such notices, if concentrated in our colmms. would enable us to accomplish the desirable object of increasiag our sheet from eight to sixteen pages, and so improving the paper as to give it a still wider circulation, and thus return to the comp nies, by its general usefulaess to the mining interest, four fo'd value for the patronage which they are asked to bestow to enable us to accomplish the end desired. We throw out these hints for what they are worth. The mining public can judge from what we have done to make a mining paper, what might be accumplished under more favorable auspices. The need of a first class muning paper all admit. There is ample business in this city to support it if it can be concentrated. It will cost the mining interest no hing beyond what they now pay -nay, less thau they are now paying, to establists and sustain such a paper. Will they do it?

A Most Elegantly Finisbed and ingenious piece of mechanism may be seen at the Machine Shop of Mr. David Stoddart, at the corner of Pine and front Streets, the same being a patent Injector, recently parchased by the Gould \& Curry Co., for supplyng the steam boiler of their mill with water.
This instrument is one of the most ingenious devices which the inventive genius of the age has produced. It bas been pronounced, by the most eniuent French Lingineers, when used as a feed-pump for steam boilers, as absolutely perfect in theory, and the best, most reliable and safest apparatus which has ever been invented for that purpose. The A caderay of Sciences, of Paris, have awarded the inventor what is known as the Montyon prize of 1000 francs, for having produced "the most deserving invention of instruments useful to agriculture, the mechavic arts, or science," for the year.
The inveution was first introduced some four of five years since, and is fast coming into geveral use all over the world. The California Steam Navigation Co. bare them upon eight of their boats; there are six in use at the Mare Is.
and Navy Yard. They are now being introduced into the mines of this State. The one above alluded to, designed to be put up at the Gould \& Curry Mill at Washoe, is well worth the attention of mechanics, as well for the beanty and style of its finish as for the intrinsic merits of the invention. Mr. Sroddant is agent for the sale of these machines on the Pacitic Coast.

## THE MINING STOCK MARKET.

No material change has occurred in the Mining Stock Market during the week. The same discrimination noted for a few wecks past still contiuues to govern operations, A few stocks of accepted value have advanced duting the past six days, while some shares of real merit have receded, through mere neglect, on the part of buyers. Stocks, especially in a fluctuating market, seldom remain firm at any figure, for any considerable length of time, without dematid. This is particularly the case in speculative stocks, or those whose value is based chielly upon prospective developments.
Gould \& Curry is still advancing and holders are mors colfident than ever, of the large dividende in future. The closing bid for these shares on Saturday was $\$ 5,100$, with $\$ 5,200$ asked. The advance during the week has been $\$ 700$.
Ophir is still declining. We quote to day at $\$ 2,150$. The continuance of low dividends, and large anticipated disbursements for additional mill facilities, etc., are bringing into the market the shares of irresolute holders, and a decline is a natural consequence, notwithstanding the firmness manifested by large stockholders.
The New Almaden Quicksilver Mine, according to the Mercantile Gazette, is in active opera'jon, the yield being abundant, and everything progre-sing quietly in the usual routine. The shipments of Quicksilver from this port, chief. ly the product of this mine since the lst of Jauuary last have amounted to 17,182 flasks (of 75 地. each) agains! 13,500 flasks for the same peried of last jear.
Sarage has further advanced and may be quoted at $\$ 2750$. It is expected that the first dividend of this Company wil. be paid the first of August.
Chollar.-The directors of this Cumpany levied anotheln assessment of $\$ 72$ per foot on Saturday last. The Stoch has been in considerable demand the past week, at an adk rance, but a decline may be looked for this week in conse quence of the uew assesement.
Potosi has attracted "nuch attention. On Wednesday some of the large holders threw their Stock on the Market at $\$ 400$ (6) $\$ 450$, with considerable sales, causing a panio amongst those who had been auxious to purchase early ir the week at $\$ 500 @ \$ 550$. At the close $\$ 450$ was offered for snall lots.
Daney has been in demand during the week at $\$ 390$. Thi dividend for June on 200 shares has been sold for $\$ 13 \frac{1}{6}$ per toot. One lut has been sold as high as $\$ 15$. Sanguiar holders.are expecting \$20.
Burning Moscow has been considerably dealtin, the past week, mostly on time. Much anxiety is felt by holders with reras d to the issue of the Ophir injuaction.
Yellow Jacket is greatly in favor, and closes firmly a: $\$ 925$.

## Overman may be qquoted at $\$ 200$.

Wide West commenced at $\$ 205$, and closed at $\$ 215$, witl a strung market.
Silver Hill sold as low as $\$ 34$.
Real del Monte, $\$ 140$; Utah opened at $\$ 60$, and closer firm at $\$ 70$; Bamboo, but little dealt in at $\$ 55$ to 60 ; Pont dropped to $\$ 20$, with considerable sules; Sunbeam, $\$ 7$ Rhodes Diggings, uccasionally bought at $\$ 35$ to $\$ 10$. Jo sebhine, a declining market, last suld at $\$ 1350$. Wiltor Springs, 650 to $\$ 8$. Union, (R. D.) $\$ 225$ to $\$ 250$. She , has a dull market, closing at $\$ 410$. Melones, adrancer to $\$ 115$. Sacramento and El Dorado, sold at $\$ 70$, withou any feature.
Lucerne is inquired for at $\$ 18$ to $\$ 19$.
Lauly Bryan has a uarket at $\$ 7$ to ap $^{7} 50$.
St. Louis has been largely operated in at small prices. Mt. Davidson is more in demand, and has reached $\$ 5$.

## THE COMPET INTERDT．

he C＇opper Interest is fast assuming a leading importance rroughout the state．The shipm ints of Copper Gre from ir interior are constanty increasing，while buyers of the efrom both home and forcign narkets，are multiplying in iis City．Capitalists have now become fully alive to the aportance of this new interestand the ateady adrauco of pork in reliable mines，is u sure index of the confidence felt their value aud permanence．Coppor ruises，in all arts of the world．have ever proved the most reliable and niform in yield，of any of the precious metals，and the meticed ege of uumerons experts from Cornwall and other upper mining regions，recognize，her，the same unmistuk－ We evidence of permanence and uuiformity which charac－ rise the nines of this metal elsewhere．
In addition to this most encouruging evidence，we have Iso the admitted fact that the mines or Califorvia，as a hole，so far as developed，far exceed in richness those of ny country，unles3，pertaps，we mag except those of Lake aperior．Ilenceit is not at all a matter of astonishment， hat public attention should be so strungly inclined in this irection，or that the Copper furore should even exceed the ilver mania on Montgomery st at high noon of cheerful day． From the Mines of Calaveras County we coutinue to ear the most cheering accounts．The product of the mines f that region is constantly increasing in quantity and im roving in quality．Stock in the Union Mine is estimated a high as $\$ 1,000$ per foot with none offering．
Tho Keystone，adjoining the Union may be quoted at 150 per foot，with but little offering．This miue has a arge force employed．Concentrating machinery is now be－ ug put in operation in connection with this mine．
The Napoleon may be quoted at $\$ 150$ with $\$ 250$ asked． the vein of ore in this mine is rapidly improving．
The Josephine，an extension of the Napoleon is offered t $\$ 35$＠$\$ 40$ per foot．We are not informed of the prog ress of the work upon this mine，although？we believe con iderable is being done．
The Newton，in Amador County，is still raising and for－ varding very rich ore．The mine promises well．We are hot aware that there is any of its stock in the market．
The Copper Mill Company is in the same vicinity，and is 180 coming into notice，although they have no stouk in the market．The Company is shipping ore．
In the Campo Seco mine，Calaveras County， 1225 feet banged hauds a ferv days since for $\$ 24,750-\mathrm{a}$ fraction over 20 per foot．
We understand that a fen of our prominent brokers are bout to visit the miues of Calaveras and Amador，to de－ ermine for themselves the capability of these mines to pay he dividends predicted by the present owners．We pro pose a trip in that direction ourselves，as soon as the con－ entrating machinerg now in progress of erection shall be pat infoperation．

From Placer and El Dorado Counties，we hear highly fa fourable reports．Much activity still exists in these Coun－ fies in the search for new，and the development of discover－ ed mines．
Similar reports reach us from Nevada County，although our advices from that quarter are not as full as we wish they were．Our correspondents，in that direction are somewhat remiss in their favors；in consequence，probably，of too much personal interest in feet．We learn that the＂Last Chance，＂of Rough \＆Ready have filed their certificate of incorporation．This stock is estimated very high．We un－ derstand that offers of $\$ 70 @ \$ 80$ per foot fails to loosen the grasp of holders upon their favorite stock．The mine at －llast accounts showed a 15 －foot vein，well defined．

In Butte County rich indications are constantly being fonnd，and prospecting is going on with much spirit．
In Del Norte，the lack of road facilities，and scarcity of experienced laborers is operating quite unfavorably to the development of the mines，although mcst excellent indica－ tions and prospects are everywhere found．These hindran－ ces will socin be obviated．T＇he Mammoth，from that sec－ tion，exhibits fine ore in this city－So also does the Alta．

At the Mount Diablo mines work is being vigorously prosecuted with encouraging prospects，but，so far as we have been able to learn，with no important results up to the pres ent time．

## ESMERALDA STOCK LIST．

［Corrected for the Miniug aud Scicutatic Preas，Miay 26，1862．］
 ing，which th is belioved will $y$ teld over $\$ 200$ to the ton．
The Ciucimawa has also a large amount of rock out at the shaft which is －－．
Triatrical－We Wave for some time contemplated sup－ plying our numerous readers in the country，with short the－ atrical criticisms，so that，on visiting the city，they may know where to find the best entertainment．This week， however，we have to confine ourselves to the Eureka，where the San Franciaco Minstrels nightly hold forth．Since the Eareka opened with this troupe，it has been well patronized by large audiences of both sexes，and it is well understood now，that the most fastidious need not fear meeting with anything vulgar in the performances．The singiog is of the firss－class character，with the solitary exception，perhaps， of a little too mach instrumental accompanyment．Birch and Cotton this week，in the＂Black Statue，＂＂Virginny Mummy，＂and＂Scenes in the Police Court，＂have been very happy．Let those given to fits of despondency take a dose of their drollery，and we vouch for a better frame of mind．Those，loving good music，and a good laugh，are un－ just to themselves，and these popular actors，if they omit visiting the Lureka．

## POST－OFFICE COMPLAINTS．

We hear frequent complaints from subscribers in varions quarters，with regard to the non reception of papers，＂and have found it impossible，in several places to extend our circulation，for the only reason that the＂Press＂can not be where the fault is．The paper is regularly mailed at the San Francisco Office，done up in strong wrappers，and carefully directed．Subscribers who tail to receive their papers regu－ larly should first learn from their local Oflice，whether，when the papers do arrive，they come in good order，or whether adI the facts to us．We will then endeavor to learn the cause
of the irregularity，aud sq far as possible rectify the same．

## WHEELER'S

Amalgamating and Separating Pans.
It is acknowledged by all who have examined the principlos and witnessod the operation of these Pans, that they are decidedly superior for trituratiog and amalga-
mating purposes to any other in use. mating purposes to any other in ure.
The minst important principle connected with the ope-
ration of these Paus is the separation of the triturating ration of these Pans is the reparation of the triturating
process from thrt of exrracting the amalgam from the process The chier cause of loss of the previous metals arises from the passing off of the same in combination with the quicksilver, during the proces of trituration, aud in cleaning up. By the introduction of the Separating Pan
to follow the trituration this loss is entirely aroided. to follow the trituration this lose is entirely aroided. I
workiug these machinos there is no appreciable loss of guicksilver, and hevee none of the precious metals.
Dy the silue of othors on sands from the same vat, the Wheeler Paus have uniformly gained a large percentage of metals over its competitors, as well as a still larger percentage in the amount of work performed.

# THE MINERS' LabORATORY.-NO. VIII. 

DW MINERS YAY FORM AN APPROXIMATITR IDRA OF THE PRRCENTAQE OF COHIEK IN THEIR ORES.
[ Miners and others will find the following, which has been aished us by a skilliul chemist, a very simphe and coliable ethod for ascertaining the percentage of copper in their fes. Parties from a distance wishing to provile themselves fith this simple appiaratus can do so lyy remitting to us the mount of $\$ 20$, free of charge, in return for which we will rward the apparatns by express.]
The following apparatus and chemicals are necessaryIx glass bottles, to hold about 8 uzs. each, the buttle must flat and wide and the grass very clear; 1 funnel; cekure of filtering paper ; apothecary balance, which will 3. about $\$ 5$; nitric acid and ammonia, of each a quart, dd about oue ounce of very thin copper wire.
Weigh out the following quantities of the copper wire, parahly :-4 grails, 3 grains, 1 grain, $1 / 2$ grain, $1 / 4$ grain, Ssolve each one by itself, in nitric ach. When dissolved fd ammonia untit it suchlls strungly. Transfer the several flutions, each one by itself, into an 8 oz . bottle as before seribed, and fill up with water ; cork tighty.
The hottle containing 4 grains, mark No. 4, the one conining 3, mark No. 3, and so on-each one representing by number, the number of grains of copper dissolved.
You have now six bottles, each coutaining a kuown quany of eopper ; the greater the amount of copper the darkthe solution is. After doing this, you have a standard Hution which will last for years, if properly kept.
When you have an ore to assay, pulverize it very fine, and ssolve 20 grains of it in nitric acid. When the whole has pen dissolved add a mmonia as above until it smells strongi. Gilter the solution and wash the residue on the filter, by lowing a litfle hot water to run through it so as to obtain jo whole of the blue solution. Transfer now, your blue umonical solution into an 8 oz bottle. If jou have not fficient of the blue solution to fill it up, do so by adding tater. When this in done, compare the colored solution so ftained, with the four standards, which we have already pseribed. If it is as dark as the one labeled No. 4 , is plain that you have 4 grains of copper in your bottle, d that is the quautity of copper in 20 grains of the orederefore your ore contains 4 multiplied by $5=20$ per cent., copper. If the solution you have obtained from the ore not su dark as that of No. 4, compare it with No. 3; if corresponds, then 20 grains of the ore contain 3 grains of ppper, or, 5 multiplied by $3=15$ per cent of copper. If it co the same color as any of the others, proceed in the mie manner. But if you find that it is darker than No. 4, four it inlo a tumbler, and mix it with an equal quantity of ater; shake it up well, fill your bottle with this reduced plution and compare it with No. 4. If it be as dark, then an have twice 4 , or 8 graias of copper in 20 graius of re, which is equal to 40 per cent of copper. If it be of a ghter color than No. 4, compare it with No. 3 ; should it smpare, then you have twice three, or 6 grs. in 20 grains of ro, which is equal to 30 per cent of copper.

If you find that your solution from 20 grains of ore be only of the same color as the ore marked, No. ${ }^{1} 4,20$ grains of your ore cuntains only $1 / 4$ of a grain of copper, which is equal to 11,4 per cent of copper.

## GLOSSARY OF MINING AND METALLURGIC TJRMS.

For convenient reference, we have prepared the annexed glossary of the technical and provinctal terms relating to the science of mining and wetallargy, which inclades most ot those in use in this country anā in books treatiug of these subjects. The fact that a great number of Cornish and German miners a e employed in our mine; rea ily accounts for the introduction of foreign, provincial words, many of which are already in fumiliar use in the Iake Superior copper region; othres are used in foreign works treating of mining and metallurgy, and have been adopted in Finglish books, when we have no word expressing exactly the same idea.
In the glossary, the letter $C$, affixed to a word significs that it is of Cornish origin; $F$, follows a term adopted from the French, and $G$, from the German language.

## glossary.

Abstrich.-(G.)-Inpure litharge obtained in the operation of separating silver from lear ores.
Abzug.-(G.) - The first, very impure litharge which is formed in the operation of cupelling argentiferous lead ores.

Adli-adit-levei- $\Lambda$ horizontal excavation or gallery through which the mine is drained. Ithe adit-level is usually commeneed from the bottom of the lowest neighboring valley, and extended through the workings of the mine.

Adventurers.-Sharehulers, or those interested in a joint mining enterprise.
Aiv-muchine.-Apparatus for ventilating a mine by withdrawing the foul air trum it, or by forcing in pure air from the sumface.

Alch.-A piece of ground left unworked near a shaft.
Altle.-Rubbish; ruck containiug too little ore to be worth working.
Aeerage stindard.-(C.)-The price per ton of the fine copper in the ore, after deducting the charge for smelting, which amounts, at Swansea, to $2 \mathscr{L} 5$ s. per tou of ore
Buch.- The back of a lode is that part of it which is nearest the surface in relation to any portion of the workings of the mine; thas the back of the level is that part of the lode which is above.
Bar.-T'erm applied in Cornwall to a vein of a different description of mineral crossing the lude or country.
Beal away.-'I'o excavate ; a term usually applied to hard ground.
Bed.-A seam or horizontal deposit of ore.
Bend.- (C.) Indurated clay; term applied by the miner to any hardened, argillaceous suhstance.
Bhark juck.-(C.)-Hende, sulphruret of zine.
Bust.-I'he air iutroduced by the blowing apparatus into
Blower.-(C.)-A smelter of ores.
boumds.- (C.)-'the limits of the ownership of a tract containing tin ore.
Brasque.-( $F$.-A lining of closely-beaten charcoal, or other carbonaceous suhstance.
Brunch.-A small vein which strikes out from the main lode, or branches from it.
Biood-Tmpurities mixed with the ores.
Broil.- The traces of the pre-ence of a lode found in the

## loose matter at or near the curface.

Buchers.-Men who break or bruise tho ore.

Buddling.-Separating the ores from the mixture of earthy substances by weans of a wooden frame of cistern fil ed with water.

## Bunclo-A small quantity of ore in a compact mass in the

 vein.
## Cal.(C.)-Wolfram ; tungstate of iron aud manganese.

Cand.- (C.)-Fluor-spar.
(aptain-- -uperinte dent of a mine.
Consuter (on contra) lode.-A lode forming an angle with Chermpion lodection of the other lodes in its viciuity.
Champlon lode.- The priscipal lode of a mine.
Cluck:- The valve of a pump of any kind.
Cob.-To break up the ore with hamners, so as to sort at the valuable portion of it.
Cockle.-Schorl, or black tourmaline.
Coffin.--Old workings open to the day.
Cumb.--'The arrangement of the mineral contents of the lode in parallel, crystalline masses.
Cost-bonte system. The method of working n mine according to certain regulation as, by which the adventurers may at any time "sign off," and ceuse to be liable for any further expenditure in proving the mine. The plan is to insert in the "cost-book" the name and address of each of the adventurers who first work the mine, with all the subsequent transfers of shares, and every expense attached to the undertaking ; a meeting of the proprietors is held every two months, at which the purser presents his accounis, made up to that period, and the share-holders are thus cnabled to judge of the state of the undertaking before incurring any further liabilities.
Country.-The strata or rock which the vein traverses; he rock in the neighborhood of the vein.
Course. -The direction of the vein.
Cross course.-A lode or vein which intersects anotherat considerable angle, and which frequently throws the first cut of its course.
Cioss-course sprur.-(C.)-Radiated quartz.
Cross cut.-A level driven at right angles with another to tersect the lode.
Crop. - The best ore.
Crop out.- To come to the aurface; referring to strata.
Cius.h-To prind the wres without water Crus.7-To grind the ures without water.
Cut- 'To intersect by drivilg or siuking.
Costerning.-Discovering the situation of a lode by sinking pits in its vicinity, and driving transversely to intersect

Cofering. - Securing the shaft from the influx of water by ramning clay, de... alound the sides of the timber.
Dam.-(C.)-Choke damp; foul air.
Drarlinge.- (G.)-Residue of copper in the process of separating silver from copper in the liquidation process.
Derd-work.-Work where the vein is not productive, or Dork which is done without obtaining any ore.
Deads.-Rubbish ; attle ; veinstone barren of ore.
Deads.- Rubbish ; attle ; veinstone barren of ore.
Dialling.-Mining engineering ; surveying within a mine.
Dish. - (C. - 'That portion of the produce of a mine paid rent to the owner or lard.
Dissueing.-Breaking down the strata from one of the wal s of a rich and narrow vein, so that it can afterwards be taken down without loss or waste.

Dropper:-A branch which leaves the main lode.
Driving.-Excavating in a horizontal direction ; opposed sinking or excavating in a vert cal direction.
D. ift.-Morizoutal excavation

Dress.-To clean the ore hy breaking off fragments of the gangue from the valuable ore.
Eilvans.(0.)-Dikes of graniter and feldspar; porphyritic clis cutting the slates and granites of Cornwall.
Engine-shinfl. The shaft by which the water is drawar from the lowest portion of the mine.
Feeder.-A branch falling mito the main lode.
Faull.- A sudden interruption of the continuity of strata
in the same plane, accompanied by a crack or fissure of width varying from a mere liue to several feet.

F'luccun--Decomposed, clayey matter, accompraying th slides and cross-courses, and sometimes the lode itself.

Foot-uacll.-The wall on the lower side of the lode.
Gengue.-The now-metalliferous portion of the lode; the mineral substances accompanying the ore.

Gad.-A pointed wedge of a peculiar form, having its aides of a parallel figure.

G*ark upfer ( $G$ ) -Refined copper.
Gliso - (0.)-Mica.
Good levels.-Nearly horizontal levels.
Gossam-Oxide of iror, intermixed with quartz, general ly found near the surfice, in the lode or accompanying it.

Grass.-The surface ; the open air.
Growan.-(C.)-Decomposed granite.
Ground.-Tha rock which is adjacent to the lode; the strata in which the lode ocenrs.
Gulph of ove.-A very lagre deposit of ore in the lode.
Hanging-wall-The wall or side above the lode, in con-tra-distinction to the foot-wall.

Heave. The horizontal dislocation which occurs when one lode is intersected by another having a different direction.

Horse. -The deat ground between two branches of a lode. Joggling-table.-Itelined board, and which is made to move with a sudden and quack motion, used in washing the the ores.
Jig.-To separate the nre with a riddle wire-bottomed sieve, the heavier substance sinking to the bottom of the sieve.
Sieve.
Junction.-Point where two veins, or different rocks, unite.

Keeve.-A large vat.
Kibble--The bucket in which the ore and attle are sent to the surface.

Killos.-(C.)-Clay slate.
Kupfer-stein.-(G.)-Regulus from coppery-lead ores twice roasted.

Lander.- The man who attends at the mouth of the shatt to receive the ores as they are sent to the surface.
Leader:-A hranch of the main vein.
Levels.-Galleries driven on the lode at various depths, generally at intervals of ten fathoms.
Liflers.-Wooden beams to which the stamp-hends are fastened.

Lode.-Regular vein producing ore.
Loupe.- ( $F$.) Bloom, from the puddling furnace.
Matte.- $\left(F^{r}\right)$-Regulus, melted sulphuret.
Mock leud.-Blende, sulphuret of zinc.
Moor slone - (O.) -Granite.
Mundic.-(0.) -Iron pyrites.
Necdle.-A loug, taperng piece of copper used in tamping the hole for blasting, in order to leave a cavity for inserting the safety-fuse.

Pack.-Gang, or party of men.
Parcel. - A heap of ore ready for sale.
$\boldsymbol{P a s s . - A n ~ o p e n i n g ~ l e f t ~ f o r ~ l e t t i n g ~ d o w n ~ s t u f f ~ t o ~ t h e ~ l e v - ~}$ el.
$P$ each-(O.)-Chlorite.
Pick.-A common instru
Pick.-A common instrument for mining and agricultur-
purnoses.
al purposes.
wall. wall.
Pitman.- One employed to look after the lifts of pumps
and the drainage. and the drainage.
Pit-work.-The
Pit-work. The pumps and other apparatus of the en-gine-shaft.
Point of the horse.-The point where the lode splits or divides into two parts.
Pot-grown.-(C.)-Soft decomposed granite.
Prian.-(C.)-Soft, white clay, esteemed in Cornwall a favorable sign, when found near a lode.
Rack.-An inclined frume on which ores are washed.
Reddle.-A sieve for washing the ores.
Rosette.-(F.)-Dish of refined copper taken off from the
surface by throwing on cold water.
Run of a lode.-Its direction.
Sralband.-(G.) -Plural sacilbander, selvages, or thin bands of earthy matter, generally argillaceous, on each side of the vein next the wall-rock.

Selt.-The portion of ground taken on lease for mining purposes.

Schlich.-(G.)-Finely pulverized ore mud.
Slag.-Sillicious substances formed in the various processes of smelting and refining, principally silicates of the protoxide of iron, alumina, lime, and magnesia, generally containing a small portion of various metalic substances.

Shaft.-A vertical or inclined excavation in the lode or through the country.
Spleissof en.- $(G$.$) -Copper refining furnace with two re$ ceivers for the fused metal.
Shears - Apparatus for raising or lowering heavy articlea in the shaft.

Shelf.-The solid rock.
Sholing.-Tracing the situation of a lode hy means of the loose masses of ore and veinestone which have been separated from it and scattered in its neighborhood.

Shooting.--Blasting with gunpowder.
Shooting.--Blasting with gunpowder.
Sinking.--Excavating downwards in the shaft,

Slicle.-A vertical dislocation of the lode.
Slickensides.-Pulished, argillaceans surfaces of the rock, caused by the rubbing and griuding of large masses arainst each otler.
Stockwer-k.-(G.)-An assemblage of small irregular strmgs of ore, which has no regular form like a true vein, but in which the ore seems to have been disseminated thro' the fissures in the rocks.
Slimes.-Metallic ores mixed with finely-comminuted par ticles of the rock.
Smell.- The reduction of metals from their ores by the aid of heat, in the usual metallurgic treatiment in the large way, is called smelting.
Suller:- The small platform at the ond of a certain uumber of ladders.

Spulling.-Breaking up the rock into small pieces for the
purpose of separating the ore.
Stamp.- 'l'o break up the ore and gangue by machinery, with the aid of mater, for the purpose of washing out the hea vier matallic particles.
Stamp-head-The iron end of the beam which by its weight breaks the fragments of ore in the process of stamp ing.
Stope.-To excavate the space between two levels by a succession of step-like workings.
String.-A small voin.
Stuff-Attle, or rubbish.
Sump.-The bottom of the engine-shaft, into which the water is allowed to run, and from which it is pumped or remored by some other means.

Trecke.-The windlass, rope, and kihble.
Tamping.--The substance with which the hole in blasting is filled after the charge of powder has been introduced; also, the proccess of fillisg the hole is called tamping.

Thrown.-A lode is said to be thrown up or down when it is intersected by a slide by which a portion of the lode has been removed from its original positiou to one side or the oth $r$.

Ticketings.-(C.)-The weekly public sales of ore.
Iribute.-The system of working by tribute is that under which the workman receives a certain proportion of the ore which he raises as a return for his labor.
Trunk.-A long narrow inclined box, in which the separation of the finely-washed ore from the earthy impurities is effected.

Tunnel-head.-The top of a furnace, where the materials are put in.

Tut-work.-Work in which the laborer is paid in proportion to the amount done-generally at so much per fathom in driving or sinking.

Tuyere.-Pipe throagh which the blast is introduced into the furnace.
Underlie.-The dip or deviation of a vein or bed from he perpendicular.
Van. To cleanse a small portion of ore by washing away the earthy matter, by the aid of a shovel or some similar implement.

Vein.-The contents of a fissure in the rocks, of indefinite length and depth.

Vug.-(C.) A cavity in the vein, generally lined with rystals.
Wall.-The side of the rocks adjacent to the vein.
Washing-1'he process of separating the ore from the earthy impurities by the aid of water, the paricles of ore and earthy matter arranging themselves in different positions according to their different specific gravities.

Whim.-A machine consisting of a drum revolving vertically by horse, steam, or water power, by which, with the aid of a rope and pulley, the ores are raised from the bottom of the mine.

Whim-shafl.-The shaft through which the ore is raised
Whip and derry:-The simplest method of raising the kibble by means of a single pulley; the kibble is attached to a rope, which is drawn by a horse.
Winze. - A shaft sunk from one level to another, for ventilation, or for proving the vein. A winze differs from a shaft in not being open to the surface, like the latter.

A Valuable Remedy.-The Boston Cullivator says: "Every family should keep a small quantity of chlorate of potash, (but with great care, as it is one of the most explosive salts known, burning with great heat. Especial care should be had not to allow it to become mixed with dust or charcoal or sulphur, and it should nut be exposed to friction.) We have never found anything equal to it for an ulcerated sore throat. Dissolve a small teaspoonful of it in a tumbler of water ; and then occasionally take a teaspoonful of the solution, so as to gargle the throat. It is nearly tasteless and not at all offensive to take; hence it is woll adapted to children.
Nothing is better than this for chapped or cracked hands. Wash them in a weak sulution, and they will soon be well. it is also good for a rough, pimply, or chapped face. It may be had at any druggists's,

## A SCHOOL OF MINES.

Some months since we prepared several articles for the Press upon the necessity of the establishment of a "School of Mines" at some point on the Pacific Coast. The ouly paper that seconded our efforts in that direction, so iar as'to even allude to such a project, was the Washoe Times, edited bs Gen. Allen, a gentleman of an enliurged aud comprehensive mind, who seems fully to understand our necessities in this particular. Some recent editorial remurks in the Times have brought out a communication to that paper upon the subject from which we exract as follows :
"I would respectfully suggest that such an institution as a 'school of mives,' should be conducted upon the most liheral and extensive scale practicable, in order to make its utility appreciable to the community at large." The vast utility of such an mstitution as this, if properly conducted,
must be of equal benefit to the mill owner and the miner; as the miner. for instance, often finds rock, of the quality of which he is in entire ignorance; this he would bring to the "chool of mines," where he could learn whether it were worth his time and labor to prospectit. The mill owner re ceives rock to reduce, with the quality of which he is nut fomiltar; he would accordingly go to the 'school of mines, where he could not only be informed of the character of the
material. but also the best way of treatime the same to the most profitable results. Such an institution shonld must certainty commend itself to all classes of society, buth in this Peritory, Califurnia, and all thuse interested in the velopment of the mineral resources of this western p at least. It would be idle to expaciate upon the details of so importaut a step as the one you have proposed, until it is seen how the public will appreciate your most valuable suggestion. It is strange that this mineral portion of the continent should have blundered on so long without an in stitation of this kind, which muștat once suggest its portance to even the least reflective mind.
We have a vast country around us, and travel on whichever point of the compass you may, you find a country charged to repletion with mineral wealth, which only requires talent and industry to develope. It is a subject of the mos vital inportance that labor should not be uselessly applied and that there should be some guiding power that the miner could bave immediate access to, which would direct his course, and frum which he could ascertain the prabability of the results of his hard work. 'There is no institution, in a society constituted as this might be, that could hare so large a field of usefulness, and one whose influences would be more generally beneficial to all portions of society as the one jou have suggested. The capitalist would recpive as much benefit as the poorest member of society; he would be able to inform himself as to the nature and value of the minerul for the development of which he was called upon to advance his money, aud thereby lessen his risk. The miner would know what he was likely to expect from the labor he was bestowing upon his discoveries. The mill owner would
be in no doubt as to the treatment of the various ores that might be brought to him for reduction. We should cease to hear of any one saving their tailings for the purpose of reworking them, and subjects that appear now blindly speculative would, hy the aid of such an institution, be made profitable to the whole comraunity.
Wishing your effurts in this direction every seccess that this vastly impurtant subject demands and deserves, and at the same time not wishing to be placed prominently forward, but willing to afford all the aid my poor ability can in its promotion, and anxious to co-operate with any other gentlemen who may be of the same way of thinking as myself, I remain

Yours, respectfully,

## CAVITJES IN PRECIOUS STONES.

The Philosophical Magazine fornishes an exceedingly intaiesting paper by Sir D. Brewster, on cavities ubs ervable, by microscopic power, in diamonds, topaz and beryl. Several years ago the learned author discoverd in these cavities two new fluids of different density. One of these, named cryptoline, is fixed and oily; the other Brewstoline, is volatile.
From the several curious observations and facts recorded in that paper we extract the following:
"In the Koh-i-noor diamond, which the Prinee Consort kindly permitted me to examine in 1852, I found three black specks, scarcely visib'e to the eye, but which the microscope showed to be irregular cavities, surrounded with sectors of polarized light. In the two smaller diamonds, which accompanied the Koh-i-noor, there were also several cavities surrounded with luminous sectors, and the same polarizing strua ture which indicated the operation of compressing and dila. ting forces. In order to obtain more information on thie subject, I examined neurly 50 diamonds lent me by Messrs. Hunt \& Roskell, and in almost all of them I fuond numbers of cavities of the most singular forms, round which the sub-
itamee of the stone had been compressed and altered in a
etmarkub'e manner. Thu shup of the cavities sommtimes entuarmbled those of insects and lubsters, and the streaks and mateless of culor in pularized light were of the must variegated

In exumining a large number of diamonds, which thorn emne of the ariental oljjects in the East India Co's Mu eum. I found that all these sfones contained large cavities, fad were course or flawed diamonds, which could not be cut atu briltiants, or used in rugs, or other ornaments. It see, ma, indeed, to be a general truth, that there are comparativehy few diamonds without cavities and flaws,and that this mineral is a fouler stone than any other used in jewellery. Some diamonds, indeed, derive their black color entirely from the number of cavities which they contain, and which will nut permit any light to pass between them." Further on he says: "The discovery of pressure cavities in topaz and hianonds may be considered as completing the evidence for the irneonts or gin of these miuerals, and of the rocks which, continin them. we know that ga- in a state of compression ex. istg in mine nls.* * * * The gas in these cavities, being exposed to changes of temperature while the substauce is still in a plastic sate, compresses it and gives it chat variation of density which produces four luminous secturs in polarzed light.

## LAKE SUPERIOR COPPER.

The Copper mines of LakeSinperior were first bronght iuto public notice in 1845 , when speculation was rife in all that spur of the Porcupine mountains on the sonth shore of Superior, extendiug far into tho lake, having for its base a line drawn across L'Arse Bay to Ontonagon. This was theu the Northern Eldorado. In this year operations were commenced at the Minnesota mine which is about fifteen miles backof Ontonagon. The first large mass of native copper wrighing abont seven tons, was found in a a pit dug by the original lorls of the eoil. It is now only fourteen years since this mine was opened. At that time the rapids in the Sault St Marie prevented the passage of vesse's from the lower lakes and the adventurers that sought out this new Eldorado had runny obstacles to overcome. 'Ibe country was then covered by a vast wilderness, without inhabitants, except a few Indians. All supplies wire brought from the lower lakes, then had to be passed over the Portage at St Mary, and thence carried in frail vessels coasting to the westward hundreds of miles to the copper regin 118 , and then carried on the back of man and beast to the supposed places of the copper deposit. Wivery stroke of the pick was made at a cost ten fold more than in a populated district, every disaster delayed operatious for weeks and even months.
The opening of the St. Mary canal, in 1856, has produced a wondrous change in all of this wlderness region. The fonly settlements on phe souh shore of the lake at the present time are Marquette, Portage Lake, Ontonagon, Copper Harbor, Eagle Harbor, Eagle River, and the adjacent mines, -all else is a vast wilderness without sign of human habitation.

The Copper region is divided into the three districts of Ontonagon, Keewenaw Foint and Portage Lake. Since 1845, 120 Coppar Mining Companies have been organized under the general Law of Michigan, more than six millions of dollax: have been expended in explorations and mining improvements. The Minnesota Cliff mines have declared and paid over two millions of dollars in dividends since the organiza tion and working of these companies.

Until 1860 all the Copper of Lake Superior mines was smelted at Detroit, Cleveland and Boston. Since which time a Boston company have erected smelting works at Portage Lake Superior, while some Copper ore has been shipped to Liverpool and smelted there.

## TO MINERS AND•PROSPECTORS.

In view of the frequent accidental discoveries of valuable mineral deposits, other than gold, in almost every section of the State, which bave of late been made, it is but reasonable to suppose that prospecting even in California, has but just commenced. The simplest and most universal of all metaliferous deposits is gold. It rarely occurs is any other form than that of "free gold" which is readily discernable to the maked eye. An examination of any rock ur earth for gold is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a
pan is an invariable te-t. If in rock of any description thal rock poundel fine in a mortar and washed, in the same manner as alluvinm, will naw ily expose its grold to the oa ked eye, if there is any there in paying quatity. The only axceptions, are where the gold is contained in iron pyrites, ropper pyrites containing also iron. In cither of the two latter cases the presence of gold may be readity ascertained by placing the prrites in any suitable ressel and keeping the contents at a noderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, chang ed to a dull red color, and the gold retaining its natural ap pearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.
Not so with othermetals. Silver, copper, zinc, nickel and many others appear in such a great variety of metallifirous forms as generally to defy all but the most practical and srientific eys. No description of these ores can be written which will afford any very important aid to the illexperienced in making explorations. Atter reading descriptions, however, and carefully examining the specimens described, the explorer may go out and search with nome degree of confidence and intelligence. A study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the rehest varieties of the ores known as Chlorides or Horn Silver, whieh, from the facility with which they may be worked, and their usual richuess, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.
Considering the great difficulty, in the present lack of cabinet collections, and other means of instruction, to acquive a practical minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our mineral resources, we hereby make the offer to miners, prospectors and all others, who in "their travels or explorations mнy come acruss specimens having the appearance of rarity or value, to carefu'ly examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called opon in many such cases, and we shall at all times be willing to give our atteation to any such requests which may be presented to us.
In carrying out the plan we propose, every miner and prospector should be at all times on the lookout for any new mineral. Tne ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at ance be given to it. There is scarcely a piece of quartz or rock of a quartzoze nature, which presents any uucommon anpearance in texture or color that has not been this modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place," and if the cause of its peculiarity is not evident and readily seen, it should not be passed carelessly by. There may be value in it, although the gold may not shine there. We shall commence in our gext issue a series of articles describing as accurately and as intelligibly as possible all the ordinary mineral substances which may be likely to come under the notio of the California prospector. These articles will be published under the head of "The Miner's Laboratory," and will be found of great value to the mining public. [Miring and Scientific Press, April 20.

Subscribe.-Are you a miner and not a subscriber to the Mining and Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bonght from the shelves of any bookstore in the country for the price of several year's sabscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no papre that will be read with so much eagerness by them, or one that will conves to them so full an account of the real industry of the country as the Min-
ino and Scientific Press. We invite all to send us their names and four dollur's, or liro dullur: for six months, and become patrons of the ouly mining paper printed on the Pa cific const. Those who receive a phuer with this paragraph marked may understand that it is cent to them for examination, and with the hope that it may so for mect with their approval as to wurrant their sulsseribing for it at once. It is not our usual custom to receive a subseriber for less than six months; but inasmuch as we aro anxious to introduce the paper where it is not now known, we will, fur the present, send the Press for three monthe even, on the rece'pt of one dollar, in coin or stanps. It is our belief that no one will wish to discontue the paper after being a constant reador of it for even that short period.

## mining and scientific press.

THE ONLT MINING, MECHANICL AND SCLENTIFYC PAPER ON THIS CONTINENT.
THIRD TEAR: VOUUME VI.-NEW EERJF!
A new volume of this extenamely circulated paper commenced Sunt. 11 ,
1862. It is intended that esrry number shall be raplete with infermation 1862. It is intended that esery number khall be replete with infermation
concerning Mining, Ncientic, Mechamral and Industrial pursuits, together
 for its columulnus,
This niper is devated to the nhove purposen, together with of Science, Arts, Agriculture and Compherce, tathe any wineral informatiou that may be of inturest to the reader : and it is the intention of the promirietor tospare no pains or expense in makime it equal in interest and valuable
information to any papur yet publinhed The Mining Interest!
Will find it of grant value, as it will contain all the news anpertainiug to Mining, the prices aud sales of Mining Stocks, new inventionk of Machinery
adipeet to tiat purposo, and of everythng fenerally that muy be of service to the Miner.

## The Inventor !

Will find it an excellent medum for the nurnise of bringing his invention into notice, of ascertaining the progress of inseation in this ant other countries.and alao of recejving any information that may be uecessary
in obtaing his pateut, the aroprictor having had great experience as in obthining his pateut, the proprictor having had great expericnce as a
Patent Agent, together witl facilities at Washiugton that evable hlan to ob ain Patente with dispatch.

## The Mechanic and Manufactuser !

Will be greatly bencfited by its perusal, as cach number will contan sera eral original engravings of new machines and inventions, together withy
large atmount of reading matter appertaining thereto. Wie are constantle large atmount of reading matter appertaining thereto. We are constantle
receiving the best scientife jnurnals frum all quarters, from whicls wr shall coutinue to extract whatever may be of benefit or interest to ou-

To Chemists, Archilects, Millurights and Farmers ! This journal will be invaluable. All new discoverics in Chemistry will be given, and $n$ large amnuut of information of great service to Architects and
Millwrights will be fomad in our columns. The Farmers and Plantes Millwrights will be found in our columns. The Farmers and Plantese will
not bo neglected, engravings will be given of agricultornl inuplements, not bo neglectud, engravings will be given of agricultural inplements, and
the farming interest generally will beamply dibcussed. Terms.

## GIFFARD'S INJECTOR.

No modern improvement has excited more general attention anong engineers than Giffurd's Injector. for supplying boilers with feed water, without using a force pump. Although simple in construction, it is apparently inexplicable in its operation, leadiug the observer to infer that its dis covery must have been accidental. It was however the result of scientific investigation by M. Hemry Giffard of Paris, who enunciated its theory in 1800. eight years before its introduction into practical use, and again, in a recent work in the French language, has fully illustrated the principles of its manulactnre and application. Various explanations of the Injector have been published, but usually with an array of mathematical fornulæ, which, to many practical engineers, are more mysterious than the instrument itself. Those who des re an alyebraic analysis will find the same in the Journal of the Franklin Institute for May, 1860; but inasuuch as the principle is simple, we present an explanation without mathematical formule, by aid of au illustration.
'lake a boiler under pressure of steam of 100 tbs . per square inch, with an orific one inch in diameter, opening from the steam space. 'Ihe steam would rush out of that opening at a very high velocity, sixteen times faster than water would issue from an opening lower down in the boiler. This we know from established rules. If the issuing s'eam, at the moment of its exit, could by some means be instantly condensed, it would become a jet of wat wof one four hof an inch in diameter; but still possessing the same high velocity. Now suppose that below the water line we make an opening, one-fourth of an inch in diameter, from which there will is-ue a jet of water; and fur her let us conduct th former condensed jet by a pige so that the two jets will play against each other; it is plain that the condensed jet will stop the other and penetrate into the boiler; because it moves sixteen times faster than its opponent.

This is aualagous to what jccurs in the operation of the Injector: the steam issuing from the muzzle of the perforated tabe, being condensud by contact with the cold water, becomes a jet of water of high velocity, which would pedetrate into the boiler as above illustrated, with this difference only-that, in the act of condensation, the condensed jet combines with the water that surrounds it, and carries it along the feed pipe into the boiler. The velocity of the compound jet is of course much less than that of the simple condens d jet, but there is still a large margin of force in favor of its entrance in the boiler.

We are not aware of the exact utmost excess of force in the Injector jet, but we know by experiment that an Injector, taking steam from a boiler at 60 tos., will force water into another boiler at 98 ths. pressure.
I'his valuable-invention is in extensive use in Europe and the Atlantic States, and during the past two years, in its introduction on the Pacific Coast, has met with the approbation of our ongincers, in all cases.

## THE NORTHERN MINES.

The Dalles Mountaneer of late date says . that the reports from all purts of the mines of that section, are most cheering. The resident population has been pretty thor oughly sifted of its chaff and those who remain are workers. The adventurers whe never rest easy, and who always expect to make a 'pile,' but never do, have left. The mining season has fairly opened in all parts of the country. In some districts the snow has not entirely disuppeared, but operations are going on in spite of obstructions. The gold crop will be much larger than that of any previous season; and promises to rival Califurnia in her parmest days. Ditches have been dug and water has been brought to loculities that heretotore have been destitute of that necessary article. This has been particularly the case at Auburn, Oro Fino, Elk City, and Florence, from each of which places it is confilently believed there will be a steady stream of gold. At Auburn, the supply of water, as has been stated by a correspondent, is still limited, and by no means adequate to the wants of the m ners, but despite this obstacle, Powder River will show a large gold yield the present shasob. At Flk City and O.o Fino, they will have water for ground sluiciug or hydraulic opprations, and in that way claims that have hitherto been uuproductive, will be
made to yiell largely. At Canyon City, one of the richest nuining districts in the whrle Northern country, the facilities for procurng water have been grently improved, and it is estimated that he yi Id from that lucality alone will be many thousand dullars. These mines paid well the short time they were worked last season, and with improved facilities there is every reason to believe that they will mure than realize the expectations of those who have been most sanguine as to therr richness. The great drawnack to the prosperity of the mi ing districts has been the restless character of the population. Too mach time has been spent in prospecting, and too little industry applied to the working of the clains.

## GOLDBEARING SULPHURETS, AGAIN.

Mr. Editor:-'The correspondent of the Washoe Iimes, Whom you quote in your pıper of the lith instant; pretty frecly coudumms certain processes for treating sulphurets. They du not come up to his "ideas." These, he suys, he merely iotroduced in a serres of papers; but his deseription of his own plan learts some to ask, "Can it be anything more than an ider?"
He separates iron from sulphur and fixes oxygen on the irou in the press nce of sulphur and of arsenic, which remains uualtered. At what temperature is this possible ? Perhaps he never thught of this; for heat seems to be a stumblusbluck throngloun his calculations. To prove the luss of ailver volatilized ta rousting sulphurets, he experiments at a white heat!
I this writer ever roctsted at a white heat, his ideas of the loss he incurred are duubitess of weight.
Again, according to his "ideas" "sulphurated, arsenicated hydroga" passes to "flour of arsenic" on reaching air.
Is this effected at a low temperature? if so, what is "sulphurated, arsenicated hydrogen"? Is it like "sulphurous acid contaiued in the ore"-ready made?

As a writer, this correspondent can make much of little ; as a roater he might neglect the silrer and arvid the arsenic. Where is the gold? Is there little, where there where there should be much?
Your's, \&c., d Poor Chemist.

Errata.-In an article headed "Theatrical'," on the 5 th page of uur last issue, "'he singing is of the firss-class character, with the solitary exception, perhaps, of a litule too much instrumental accompanyment," should have read, "The singiug is of first-class character", with the solitan'y exception, purhaps, of a little too much instrumental accompaniment."

Mining Glossary.- We devote a large space, in our columns today, to a very carefully prepared, and very full miniog glossary. We extract it from Foster and Whituey's Report apon the Lake Superion Copper Mines. It will be found very valuable, to all miners, for occasional reference, and occupies a legitumate position in our "Miner's Laburaturg."

Correction.-In our issue of last week we alluded to the Stone Breaking Machine, at the foot of Market Street, in this city, as the one known as "Blake's Stone Breaker." We wrote fron hearsay, but have siuce examined the same, and fi dit is something of very different construction, but an excellent machine for the purpose to which it is applied. The machine is mauufuctured in this city at the Pacific Foundry, by Goddard \& Co. We slall notice it more fully, at some future time.
We were also in error with regard to the Foundry where the "Young America Quartz Crusher" can be obtained. Thit machine is also made at the Pacific Foundry, where several may now be seen, which have been constructed for a Mine in Mexico.

Remotal.-J.C. E. Kleyzig, \& Co., have removed from their old stand on Battery street, to 733 Washington street, wear Kearny. - Sportsmen and others requiring anything is their line will do well to give them a call. See advertisement.

## THE MINING SHARE MARKET.

There has been some improvement iu the Mining Share Mrrket during the pist week, produced by favorable reports from several learling mines. A fair amount of husiness has been transacted and some little excitement experienced. The disposition to sell on the part of those who hold stuek of intrinsic ralue, is constantly diminishing, and so far as They are able, ali such are regurarly paying up their assesements, anid closely watching the development of their mines. Mming operations, on Montgemery Street, are fast becoming a legitimate business.
Gould \& Curry, which opened the week at $\$ 5500$, has graduillyadranced to $\$ 6100$. I'welve shares have been soll at the 'atter figure. This important advance has heen produced by inforuntion from the mine, that in a tusnel 200 feet lower thau the mine has h.therto bren worked, a fifteen foot ledge has been struck, averaging $\$ 500$ to the ton.
Ophir shares have also materially improved during the weok, and are now quoted at $\$ 2400$, with cousiderable sales and more enquiry.
Savage was quuted on Saturday at $\$ 4000$, an advance of \$1200 during the week. A harge number of transactions in these shares were reported during the w oek, at gradually advancing rates.
Chollar, has had an even Market, with small transactions. Potosi, sold at $\$ 460$; no new features.
Wide West has attracted some attention, during the week, 251 slares having cilanyed hands at $\$ 175$ (4) $\$ 216$. the copper interest.
We have nothing new, of special interest, from Copper opolis during the last six days. The Union cluim has thre shafts sunk to a considerable depth, from each of which theg are laking large quantitics of rich paying ore. At each the eshafts is a steam engine for hoisting the rock. Imi mense pi'es of what is called number three are lying at eacl of the shafts-too poor for transportation until it is reduc ed. It is estimated that there is more than $\$ 100,000$ worti of this number three rock now on the sarface of the Union claim.
The Keystone is now under the working direction of somi skilful and energetic copper miners, who intend to prose cute operations with enerry. We learn that 1,000 work men will probably soua be employed at this mine.
The Oriental, in Amador County, have thns far expender ouly about $\$ 1200$ upon their lead, and yet they have abou $\$ 5000$ worth of ve upon the ground, and are seventy fee deep upon their mine. The Company is out of debt, ; small, and there is none of its stock in the market.
The mines of EI Durado, Placer, and Nevada, are stil progressing, althongh we have not yet heard of any shipments of ore from that direction.
The Humbolat Register says: "The Sheba mill continuel concentrating rock for shipment. Thursday, three six-mule teams started with concentrated rock to be shipped fron San Frauciseo to Enyland."

Indorated Plaster.-Objects in plaster of Paris may bi rendered like marble by coa ing them one or more times a: may be necessary, with a liquid prepared as fullows: -2 pts of stearine and 2 pts. of Venitian soap, are mixed with 200 30 pts . of cold solution of cuastic potasea; andafter a half hour's, ebulition, l pt. of pearlash is added and the heat

More Mines.-New and rich gold and silver mines bave been recently discovered in the vicinity of Carsou City -a region where the precious metal has not been fou id hitherto. continued for a few ininuits: Cold ley in sufficient quautit; to produce perfect fluidity is then stirred in, and the liquir set aside for several days under cover.

Lost !-A Silver, Lever Watoh, hunting case, suppose to hare been lost on Bush Street; the finder will be suita bly rewarded by leaving it at this office.

Wanted.-A full set of Patent Office Reports (Mechaical Inquire at this Office.

Firt gron Irfise: River--Wells, Fargo \& Co. mado their
first shipment of imalion from Austin, locuse Kiver, un June 1hth. It was twenty pounds, the $r$ tsult of one wection work in a stuall arustra.

## GENERAL MLINING STOCK REPORT.

REPORT OF BIDS
At the San Franchaco Mining stock Board,
For the wevk ending Juae 20, 1863.

## 

REMARKS.
The Tirginia Market has beeu exceedingly dull since the date of our last refe ence, and except upon the Main, or Comstock range, there has heen something of a decline, as will be observed by our quotations. Prospecting, however, is progressing energetically, and very encouraging developments are beiug made on what may be denominated outside ledges.
In Gold Hill stocks, much more feeling is manifested, and a very general advance is occurring. During the past two months, developments of a very satisfactory character have been mude in this district; nor are they confined to the "main range." The back ledges are beginning to yield with
fair promise. But along the "main range," and the three ledges canstituting it, $d$ :seoveries are daily being made giving rise to the wildest predictions. The ledge upon which the Belcher is located, is indisputably one of the very richest in the Territory. It is the ledge lying east of the Crown Point vein. Notwithstanding the occupancy of the same ground by the Koh-i-noor, the Brlcher is held firmly at the advanced quotations given. This same rich vein runs, it is presumed, through the Leon, and has been struckiu the claims of Guld Hill proper, the Princess and the Bullion. This ledge is, without the shadow of a reasonable doubt, entirely distiuct from the back 1 dge. That they are one, is the theory upon which are based the suits between the Yel-Koh-i-noor. We refer the reader to our figures for further information.

The "Crockett" Ledge on Last Chance Rill is still incrasing in richness.

The last crushing of 22 tons paid $\$ 3,189$, averaging $\$ 145$ per ton; the shaft is now down to a depth of 50 feet, and
the ledge over five feot wide. The company have a large amount of very rich rock at the shaft, which is bring hauled at Stark \& 'l'ucker's Mill. 'The owners in the claim are not disposed to offer any of the stock for sale; 15 shares where sold on the 9 th at \$85 per share.

The " 'lan Alpiue" ledge on Last Chance Hill, a recent discovery, is proving very rich. 'The rock assays $\$ 1700$ per ton. The company have taken out abuat thirty tons of rock, which will be crushed immediately. The owners in the ledge are sanguine that the rock, withuut assorting, will pay over \$200 perton ; \$12 per foot was offered yesterday and refused. The ledge is about two feet wide und increasing in thickness as they go down.

The "Mary L. Gardiner," on Silver Hill, contiguous to the Young Winnemucca, is proving to be a very rich ledge; the shaft is down about thirty feet, and the ledge over fonr feet wide. The company have taken out about forty tons of rock, which will be crushed at Stark \& Tucker's Mill. The last ussay went over $\$ 7,000$ per ton; $\$ 100$ per share has been offered and refused for the stock.
The "Princess Royal" and "Geraldine" claims on Silver Hill, are also turning "ut rich rock. The work on both claims is being vigorously prosecuted, and from every indication from the rock now bing taken out, the owners will be richly rewarded for the money and labor expended on the claims.

The Metropolitan.-On Friday night, by the remembrance of our friend Warren, we enjoyed the pleasure of being present at the Hook and Ladder benefit. The house was not so full as we hud hoped to see, or as the performances deserved. The Bianchis, and Grossi were in splendid voice. Amidst much good singing we thought Mme. D'Ormy 's. taken altogether, was unquestionably the most finished we have heard in this city. She is not yet appreciated. We have been too long accustomed to screaming and bawling, to realize at first, the beauty of D'Ormy's voice, the assured ease, and perfect grace of her execation. Her time, however, will come. Mrs. Edwin and Mrs Judah were good as usual. We wish the boye success.

Magutre's. Opera - The present has been, indeed, a star week at this house, offering a combination of talent seldom brought before the public on this coast. To individualize, where all deserve praise, were invidious ; but we caunot refrain speakiug of Mrs. Hayne, Mr. Thaylor, and the local favorite, Mayo, as they deserve. The Lady of Lyons, Romeo and Juliet, and the School of Scandal, we thought presented some exquisite and finished acting from each member of the combination. In maty scenes of these pieces, criticism was disarmed. The educated and intellecturl portion of our community, should by no means neglect visiting Magu're's, duriug this carnival of actiag in California, for by doing so, they not only lose a rich feast themselves, but pay a poor compliment, to the energy and liberality of the Man. agement, at present sparing no expense to merit their pat ronage. The legitimate drama is a great institution.

Theatricals.-At the Eureka, this week, the performances and the audiences have both been excelient. In addition to the geueral attractions of this favorite resort of mirth-loviug peuple, O,Neile presents his "Irish Excentricities." Cotton's old "Uncle Snow," his favorite character, is a spleodid piece of acting. Night after night he convulses the house. The other principal good things were "Running the Blockade," and Birch's "Pres-dig-a-ta ter;" both admirable burlesques. By the way, white Gideon's band at the Eureka, ridicule the poor Eaglishman's "h," we fud Mrs. Mowbray at Maguire's continually using "don't never," and other American double negatives. Why not ridicule the more censurable error, or avoid it. ?

Dastaway Histrionic.-We beg to call attention to the next Dashaway Histrionic, on this day week. It is enough to say one of the "indefutigable Badgers," takes a leading part. Seriously speaking, this is one of the best amateur clubs in the State, well worthy of patronage. Apart from a strong cast in the beautiful play of Ingomar, the entertainment concludes with a grand dance. The cause also is good, and with such a programme, we wish them a full

HOWTAND, ANGEL \& KJNG
San Francisco, February 23, 1863.

## THE PLATTNER PROCESS.

Mr. Editor :-I find there is much misapprehenion here as to the "Platiner Process" for extracthog enld from eulphurets, and the extent to which it na bren used. Mr. Hittell even stated in 1861 that it ad not been "nsed on a large scale." The fact is that is so valuable that it emahled the Reichenstein is so in Sile-ria, which had been closed for centuring , be reopened and worked. In 1851 a Conncil medwas awurded to Herr Platther and Gueltner for its necessful application there. The ore is pyrites, confining arsonic and about 200 grains of gold to the in. It is ronst d and the arsenic volatilized and con-ensed-the burnt pyrites. chiefly oxide of iron, is aced in a vessel, where it is subjected to the action chlorine. This renders the gold sululle in water, nd the gold is afterwards precipisated from the sotion, antl then reduced to ingots. Professor Masatt very justly observes on this, that it is equally apicuble to the vast quantity of refuse accumulated Har other old works. Yours, \&ce,
San. Fran., June 27.
A' Poor Chemist.

## CAST CHANGED to rar iron.

Sterling's process for the conversion of cast into or iron is desprving of consideration:To a given weight of cass iron, about 1-20 to 1-5 mach serap iron is added, most conveniently by tting the scrap-iron into the hollows which it is de. ed to fill by cast iron run directly from a blast furce. The pigs are puldled as usual, takiug care at the whole be thorouglily melted. The stream of
st iron may also be rum apon the hearth of a reverstiron may also be rim upon the hearth of a reverratory containine scrap iron, beated to-a point be19 welding ; the beat is raised until both are incurrated, and the metal is then ruu into a puduling wace. With better qualities of cast iron, from 1-10 I-3 of scrap irou may be used. In order to ohtain halleable ron, harder, less fibrous, and more granathan usual, $1 / 2$ or 1 per cent. of tin is added to the illeable iron tuixtures above described. Biemuth, trmony nud arsonic will produce a similar effect. feh hard iron is said to work well while hot, under - haminer, in the squeezer, between the rolls, and in southy. Zive may be used in the form of a calamine. bout the same quantity of copper also gives additional riness of iron. Black oxide of manganese in the proporHo 16 to 1 per cent. of the mixed malleable iron, rives a - Ig the puddling process.

Artifictal Gems.-To make gems, Elbemen avails himof of the two properties of boracic acid, of dissolving itallic oxide by fusion, and volatilizing at a higher heat. His process resembles the solution of substances in water $\$ 1$ the evaporation of that water to obtain crystals. Huvif made a mixture of alumina and magnesia, in the fne proportions as they exist in spinelle, and added if 1 per cent of bichromate of potash, he added two pts, this mixtare to 1 pt , of fused boracic acid and exposed it iplatinum resting on porcelain to the heat of the porcelain flace of Sevres. - The product contained cavities lined dh minute rose-red, octuhedral crystals, harder thau quartz a infusible buture the bluw pipo--They hadd qull the
racters of the ruby. The constitueuts of emeald treatad if he sume way, gielded small hexagonal crystals, harder o quartz, and therefore agreeing with true emerald.

The accompanying cat represents the "Bryan Battery," manalactured by Goddard \& Co., at the Pucific Foundry in this city. This Battery is now exteusively employed ia every section of the State, the adjoining 'lerritories and Mexico, und possesses many advantages over most of those in use. One very important advantage attendaut upon this Battery is the small expense of its erection and the facility with which it may be moved from place to place when found desirable. Being constructed almost entirely of iron, it is not effected by the alternations of heat and moistuie, which produce such a damaging effect upon all structures of wood, in the interior portions of the Western Slope. The mill is also adupted to dry as well as web crushing. Each Battery is complete in itself and others may be added from time to time, as uccasion may require, without making any impurtant changes in the arrangement of the mill, or machinery. The Batteries after being constructed are always put up at the Foundry and perfectly fitted, b fore being sent off. Perhaps one of the best recommeudations, which can be offered
in behalf of this Battery is the fact of ite introduction into so large a number of mills as are enumerated in Gounarn \& Co's Circular. See advertisement of this Mill on our lastpage.
A Board of Brokmrs [ncorporatrd--The San Francisco Buard ul Brokers on Friday filed its certificate of incorporation. Capital stock $\$ 125.000$ in 12.5 shares of $\$ 1.0010$ pach. Trustees, - Sianuuel Purdy, G. M Blake, J. Shaffer, A. J. 'Thbias and J. D. Stevenson.

A Crocik for Three Pence. An ingenious time taker has been invented hy a citizen of Marchester. It is a slaull card, ou the face of which hangs a weighted string. The card is so figured, thal by holding in the sunshine, a bead on the string will indicate the solar time. By it the hours of sunvise ahd sunset may be also ascertnined. It is, undoubtedly, the cheapest time-piece that ever was devised.

## great basin mining company.

The above named association is now fully orgauized and prepared for aetive operation. The Company holds 55,000 feet. chiefly in Humbult County, Nevada Territory :-Among others, on the following ledgous Clyde ledge, Occidental series, Neptune series, Auld Lang Syne ledge and Frost ledge. Besides which the Company owns several town sites, large quantities of wood land, etc., etc.
The Capital Stock is $\$ 5,000.000$. The names of the parties interested are as follows:-PresidentGeorge C. Juhnson. Treasurer-George W. Gibbs.

Trustees-George C. Johnson, Messrs Billings. Teschemacher, McAllister and Jessup.
Secretary-J. H. Blood. Members-W. J. Tilley, (Sueath \& Oo.) Thomas Bell, (Barron \& Co.), W. C. Little (at Parrott \& Oo's), A. P. Stanford (Stanford Brothers), R. M. Jessup (C. S. Navigation Co.). John Wodderspoon (Cross Company), Salomon Hydenfeldt, Robert Tumer, ('Turner Brothers), Hall McAllister, J. C. Lind (at Cross \& Co.s), Charles Pace. George C. Johnson, John H. Saunders, Dr. O. G.' Knowlos, Heury ${ }^{\text {F. T, Teschomaker, G.W. }}$ Gilb, Frederick Billinis, Henry M. Hale, James Kellogg. H. M. Whitmore, O. R. Johnson, P. N. McKay, Jonathan Williams and E. R. Highton.

## CUPPER UPON THE EASTERN SLOPE.

Mr. Alexander Hertlein, has left with us some fine specimens of copper ore taken from a ledge recently opened in the Sullivan District, East of Carson River, aud six miles distant from Winter's Mill. The ore consists mainly of Blue Carbonate and assays for copper 'alone, 24 per cent. Quite a number of assays have been made from this vein, for gold and silvel, the average result of which, in addition to the copper, is about $\$ 20$ in gold, and $\$ 18$ in silver. The Company cansists of three persons, beside Mr. H., and they hold 1200 feet. It is knowu as the Red Fox Ledge. This, we believe is the farthest point northward at. which copper has beeu discovered on the Liastern Slope. From this region, southward, into Mexico, copper is found at almost all points. Our friends on the Eastern Slope are beginning to turn a large share of their attention to copper, not neglecting, the while, either gold or silver.

Notes of a Trip to Slate Range via Los Angeioos and Eu Paso.-No. 3.

## el passo.

Apric 22nd. Two of our party having concluded to re main here, we took off our freight and pitched our camp in Mesquit. (don't know about the spelling of this word-pronounced Mayskeet) Cañon, where a patch of that beautitiful bush grows about 8 teet high, covening a space of about 20 feet square.
This is the only growth of the kind in the neighborhood, and, with the springs near by, will probably form the nucleus of a great city, poco tempo. One of our party having contracted at Los Angelos, to drive one team through to Slate Range, passed on with the train, in the afternoon, with instructions to stop there and report, if good, or return.

## in camp.

The first thing to do, after pitching tent, was to get supper. We have to go out on the plain, nearly half a niile, where we find plenty of grease-wood, which grows in bushes twenty to forty feet apart, twenty-five to one hundred stems rising from one root, some as large as the thumb and many as small as pipe stems, and from four to eight feet high branching in every direction, so that one can only with diffculty, approach near enough to cut the stem at the base. This is very laborious, and generally results in bleeding hands and wrists, unless protected by strong gauntlets. With a rope, we tie up as much as we can carry and pack to camp.

## an unpleasant netghbor.

While working into my first bush, I found a nice little rattlesnake coiled up within four inches of my bare hand. I soon dispatched him and found he had only a button on his tail, showing that he was not yet eighteen months old. This greasewood makes the hottest fire of any wood I ever burned, for in five minutes after applying the match, I found the heat strong enough to melt away all the soldered parts of a coffee-pot. Mem. An iron coffee pot, well riveted, is the only style to be used here.

## AFTER SUPPER.

In twenty minutes supper wes disposed of, and it being very dark, we concluded to visit a neighboring tent, fifty feet distant, and the only one up when we were around. There we found the entire population of the District assembled under a canvas about twenty feet square, also the population of our ox-train, with Mr. McCaffey, as chorister, all actively engaged in singing the popular songs of the day, and all determined to have a jolly time so long as Mac could be with them, as he leaves on his horse in the morning, to overtake his train, now on its way to Slate Range.

I improved the opportunity here presented to take a census of the District as a reference, hereafter, to know who might be entitled to a diploma as pioneers. I registered the following names:-
Theophilus Cobb, via Virginia, Kentucky, Visalis and Slate Range, here.
Griffin H. Wiliiams, New York, Los Angeles, San Bernardino, Slate Range.
David M. Porter, via Los Angeles, here.
David Teass, Missouri, Los Angeles, Slate Range.
Peter A. Turner, Virginia, Texas, Visalia, Slate Range
Albert F. Meyers, Texas, Visalia, Slate Range.
John C. Steger, Missouri, Volcano, Slate Range.
John D. Yarborough, Mississippi, Soledad, Slate Range.
Geo. W. Yarborough,
A. J. McGaftey, Los Angeles, Forwarder.

Four of the above were absent on a trip to Slate Range,
for their tent, tools and grub. But as they came in the next day, and had been here before, they are entitled to be classed among the Pioneers, as well as our own party. These now form the nuclens of the future rich and populous District of El Passo. So we retired, "by the light of the moon," nearly all, to our blankets in the sand.

## A tiew of tue country.

1 Aprit 23d. Up bofore the sua to look around us to see what kind of a land we are in. From a barren hill of something like ashes, near by, we take an observation. As we look south-west, over the road we came, we notice a great
barreu plain, as far as the vision extends, with a chain of mountains bounding it on the right, and another opposite as and about 15 miles distant, running 15 to 20 miles soathwesterly, making the plain below us an arm of the Great Desert, about 20 miles long, to the range north-easterly, over which the road leads to Slate Range, throngh the EI Passo.
About three miles back commences a small alkaline lake, some eight miles long by three to five broad, resembling a sheet of ice. Not a bush or tree is in sight larger than the musquit by our camp. All is barren, the mountains generally appearing like cones of ashes, sharp and precipitous. Not a drop of water is any where to be found, except at six poiuts within forty-five miles, viz :- Laurel Hill, Mesquit Springs, Mountain Cañon, Desert Springs, 12 miles, and Siuk of the Tehacbepe, 40 miles, and Can or Grape Vine Springs, 9 miles south-west.
Nothing can exceed the barren and desolate conditiou of this country, while the thermometer ranges from $102^{\circ}$ in the cooler places, to $122^{\circ}$ in our tent, wheu closed, from 10 o'clock to 3 P. M.

## the miries.

We amuse ourselves to-day, in examining specinens in canip from the various leads:-Tucker, Eureka, Comet Mammoth, Boston, Ben Lohmon, Gov. Downey, Laurel Hill Manzanillo and Almadan. All look good-some very rieh. We shall visit them.
24th. Put on my wooden soled shoes and started out early to prospect and examine the lodes already taken up. We find that half a dozen men have been very busy here most of the time since last November and have lodes taken up in all directions, particularly in the vicinity of Copper Mountain and Copper Basin. They abound in Lodes in which copper seems to predominate, though the universal opinion prevails that they will run to silver. Perhaps they will, but very little is actually known of the real value of the rock and much labor is to be expended before anything like a certainty can be arrived at. Two or three feet seems to be as low down as any one has yet sunk on their lodes, and none seem to be in haste to work down while there is a good chance to prospect.

## district mining laws.

The laws here are very liberal, giving a year to prospectors to do any work, if a record is made within 30 days after localion! For the good of the country and new comers, we must try to have this law changed to a shorter time, so as to abridge prospecting and making a show of work done on the gronnd.

Firr Clay from Fustble Clay.-A good quality of clay, but not fire clay, is mixed to a paste with muriatic acid, and after some time heated to boiling.-The acid is run off the clay fully washed and dried. Clay thus trated was made into crucibles, in which bar iron was fused, without their becoming softened by heat. The acid simply extracts a large proportion of the bases (lime, iron, \&e) which tend to flux the principle part of cray, the silica and alumina; but the question of economy will influence the use of this remedy for the fusibility of clay, and it is doubtful whether the process will be adopted by maufacturers.

Hydratuc Cement.-When finely powdered marble, limestone, or chalk, is mixed to a paste with milk of lime, it hardens rapidly like hydraulic lime, has a feeble alkaline reaction, and resists water tolerably well. The mass is plastic and may be used to take large or small impressions.
The analysis of a genuine Roman mortar from Pompeii, leads to the inference that the Romans prepared their mortar from a mixture of caustic and carbonate of lime, with the addition of pulverized calcareous spar.
New Moror.-M. Boutet, a French engineer, residing in Brussels, has invented a machine which it is said is likely to do away with the employment of steam as a motive powert The machine is worked by hydraulic pressure, the principle being applieable alike to locomotives and stationary ongines. Eexperiments just made with it at Brussels lave been attended with complete sucoess.

Thr Adrora Quarty Mull. ou Bodie creek, Aurora, Mono county recently took out from one weolks run, as much amalgram as four men could carry!

## GGOLOGY AND GOLD IN ASIA MINOR.

A distinguished English Civil Eingineer, C. E. Browning Esq., recently delivered an very interesting lecture before th Smyrar Literary and Scientufic Institution, on the "Geolog: and Gold in Asia Minor," from which the following extrac is tuken
"To the geologist this country offers a field of observation that will well repay the time expended upon it. To acconn for the gradual rising of the land on a tideless coast, and t speculate on the effect that future elevation will produce o the country, are points full of the greatest interest, not oul to the mau of scienc, but it is a most important question the Gov'ment and the inhabitants of the country. The rive beds are rising so rapidly, that if human agency does no counteract the influence of Nature (and it is not probabl that the Turks will do anything, as they prefer to let Natur take her comse,) the greater part of the plains in the iliteric will become waste marshes, hot beds of malaria, fevers al plague. For instance, let us turn to the natural drainage, the western part of Asia Minor, or what I will call the Smy na Watershed, which is at least 10,000 square miles in exte and is drained by only two rivers, the Hermus and the Ca ster, neither of which is nawigable, and both of which ba within the historic peried become so raised, that the mou of the former is about 15 miles nearer the sea, leaving a pa: age now of less than half a mile to the opposite shore; at the Cayster has advanced at least another ten miles. the southwest coast this encroachment is still more visib
I leave you, therefore, to imagine what will become of t vast amount of rain that will fall upon these 10,000 squa miles iu time to come, when the rivers are still more rais and consequently less able to carry off the water. Let $h$ examine the rocks that exist-it is an almost unexplos distrcit. Smyraa has added scarcely a fossil to the cabin? of Europe; and in what museum is its metalic wealth disple ed, Here are mines of silver, lead, antimony, copper a iron, almost unrivalled for their richness; and $I$ have ventui an opinion that the day is not far distant when the gold d gings of Asia Minor will attract thousands to Smyrna. lignite coal exists in incalculable quantity, and though has been proved unfit for the manufacture of gas, its el proximity to a rich iron district will render it a most valua) addition to the resources of the empire. An abundants ply of the finest kaolin provides what is necessary for manufacture of the costliest pottery; while from the comm er sorts of clay the home requirements of the lower branog of the ceramic art can be supplied. The geological studi, in his rambles in this country, meets wth rocks of all clas, from the most recent alluvium to the oldest of the priniy rocks-from the volcanic cone, forced to the surface by ternal fire, to the stalactite deposited by drops of water.

The Calaveras Chronicle says that within five years ti a will be 10,000 inbabitants in Copperopolis and vicinity.

A New Work-Important to all Mining Companies.
Win. A. Andrews \& Co., a new firm in New York, who propose to open a Pacific Mining Agency in that city, are preparing a work to be issued about the last of July, embracing a synopticul statement of all Mining Co's in this State and the adjoining Territories. It will be published in pamphlet form, and 50,000 copies listributed, gratis, in the Eastern States, with the intention of bringing Pacific Minirg Stocks more particularly to notice in the East, for nvestment and information of the mass of the people, outside of the leading capitalists of New York and Eastern cities. Such crmpanies as are prominent befere the public, and those whose prospects are deemed worthy, will be ombraced in the 1st Volume. A 2od Volume will be issued to include all new companies formed subsequent to the compilation of the 1st. An opportunity will be offered to advertisers, for a few outside pages in the work. Mr. Legr Harnett is Advertising Agent, and Mr. J. A. Woodeon, San Francisco Corresponding Agent, of whom further information can be bad.
All Companies upon whom the Agents have not called, will please address us as above, and answer, as full as may be, the following questions :

1. Name of Company.
2. When discovered
3. When incorporated, and where.
4. Extent of Claim.
5. Capital Stock.
6. No. of Shares
7. Assay per ton: Gold, Silver, and Copper.
8. President and Secretary, Board of Trust's.
9. Location of Office.
10. Such additional information as may not be mbraced in answers to the foregoing interrogatories.
Note.-Specimens of Ore requested, labeled, for reference Cabinet of New York Office.
W. A. ANDREWS \& Co.,

Pacific Mining Stock Agents, New York.

SPECLAL NOTICE.
We wish it distinctly understond that all the interest which Julius Silversmith ever had in the Mining and Scienific Press, ceased in Nuvember of 1862. Efifer \& Smitta are now the publishers and proprietors.

## MININGANDSCIENTIFIOFREが

THE MINERS' I.ABORATORY.-NO. LX.
Description of the mode of dresesng copper-ores in cornwall.
The ores consist chiefly of corper-pyrites, intermixed with small quantities of other enpriferous minerals, iron pyrites aud the constituents of the vein in which the ore is found.

The ore is drawn from the shaft to about 30 feet above the surlace and taken in wagons to an anjuining dre-siug floor, where it is allowed to fall from this height on two rows of inclined bars, by which neans it is separated iuto three divisions or sizes; called rucks, roughs and smalls, for convenience of dressing. In the first or top row of bars, which separates the rocks, the bars are 4 inches apart, and in the second row, which divides the roughs from the smalls, they are $11 / 2$ inches apart.

The rocks are broken by a process called spalling, into pieces of about one pound weight each. A small hammer called a sledge, is used in this operation, which is conducted generally by girls, who carefully separate the ore from the refuse. The richest part of the selected ore termed pril s, is taken without any lurther preparation, to the crusher which eansists of two iron cylinders, or rolls revolving against each other. Ihey are worked by steam or water power, and between them the ore is passed, and reduced to a size small enough to pass through a sieve divided iato holes of $1 / 2$ inch sqnare. The preparation of the ore is now completed. The poorest part of the ore selected from the rocks, called dredge, conlaining from 10 to 20 per cent. in copper, dissemminated through a large bulk of matrix, is also crushed and passed through a sieve of holes about $1 / 4 \mathrm{in}$. squa e. This prepares it for what is called jigging of which the object is the separation of the ore from its matrix. The ore is put into a sieve of boles one-sixth iuch square, suspended in a large cistern of water. An op and down motion is then communicated to it by a break-staff, or lever worked either by girls or by steam or by water power. By this operation the lighter particles or refuse, on uccount of their lesser specific gravity rise on the top, and are carefully skimmed off with a small wooden scraper. Thie ore that passes through, together with what stands in the bottom of the sieve, is then ready for the market. The roughs from the second row of bars are $p$ aced uader a stream of water to clean the ore from all extraneous matter, so that the copper ore may, from its colour, be readily distinguished from the refuse, which is easily separated by what is termed hand picking, an operation conducted by girls who sit on tables near the stream. The picked ore by this operation is divided into prills and dredge aud treated by the wethods before described.
The smalls from the first operation are thrown on a griddle or sieve of hules $\frac{1}{2}$ inch square ; the coarse or larger partioles which do not pass tbrough, ar s subjected to presisely the same treatment as the roughs, and the fine and smaller particles, if rich are ready fur the market; but if poor they are jigged through a sieve of holes $1 / 4$ inch square preparatory to sampling.
The prills and smalls are then carefully mised together into one pile or parcei, the dredge usually formiag a separate parcel. The pile is then equally divided into 4 or 6 sub piles, or doles, the number being $r$ gulated by the weight of the parcel; if above 20 tons it is divided into 6 doles, and if below that weight into 4 only. This division into doles is effected by means of a measure called a barrow which when exactly filled with the ore weighs about $1, \frac{\mathrm{cwt}}{\mathrm{c}}$, the number of barrows is carefully noticed, and, the exact weight of one being ascertained, a rough estimate of the total weight of the parcel ean then be arrived at for the ticketing or sale.

Separating Stlter from Lead.-The Nevada Trauscript says that the Messrs Cassamayo, formerly of Nevada, have discoverd a. process by which the silver can be separated from the lead at a trifling expense, and are busily engaged in arranging the machinery of their mill; Their ledge is very rich in silver, but being mixed with lead has proven unprofitable, owing to the heavy expense of separating it The ledge and mill are in close proximity to each other and are situated about one mile and a half north-west o Wrshoe.

## A. NEW INFLAMABLE GAS.

Every new discovery in science, whi e it extends the dominion of useful knowledge, alsō offers up wider and grander prospects for luture explorations. Rapid as have been the recent advanc sin chemical science; great as are the triumphs already dne to resea ches in this direction, still, how little is actually known of Nature's grand operations! Scarcely a scientifie journal comes to us from the Elast that does not contain somethiug ne $v$ in the iuteresting science of Chemistry. 'I'he following account of an important discove $y$, recently announced, may le the entering wedge which will open up sume other of Nature's deepest mysteries. We quote from the "London Journal of Gas Lighting :"

At a late meeting of the Chemical Society, Mr. Parrett stated that. some time ago, while Mesirs. Buff \& Wohler were making some experiments upon electrolitic decomposition. they employed a pla e of the metal aluminum as the negative terminal of the batterytor the decomposition of water and, as soon as the electric current was established, they were surprised to fint that, insteud of pure hydrogen gas being evolred, as is usual with a platinum plate, a gas was evolved which iuflamed spontaneously. Uponinvestigation, this was fuund to be composed of hydrogen and silicum, the latter being an impurity in the aluminum plate. Several processes have receutly been adopted for preparing this gas. silicated bydrugen and silicate of magnesium were found to furnish the bist materials for produciog it. Nr.Hofmann recommends the folluwing mode of making it.: Take 80 parts of fused , hloride of magnesium, 70 parts of silicofluoride of potassiunt, 40 parts of sudium cut into small ppices, and 20 parts each of the chluride of potassium and sodium. These ingredients are mixed together dry, placed in a crucible, and quickly heated to redness. The product thus obtained is a silicate of magnesiu (Mg2 Si.) When this is triturated in a mortar with hydrucloric (muriatic) acid, it gives off an abu:dance of gas, which keeps up a lively combustion in the mortar. A bottleful of this gas, prepared by Ur. Hufmann, was let off by a tube, through a truagh col taining dilute hydrocloric acid, and, as it ecaped in bubbles at the surface of the liqnid, these inflamed immediately and spontaneously when they came in conlact with the atmosphere. Each bubble produced a white liame, like that of phosphuretted hydrogen. The combustion formed flakes of silica, which resembled fumes of burning zinc. This is one of the most dangerous gasses, and further investigation may prove that many buysterious fires, directly attributed to spontaneous combustion, may be due to it. Dr. Hufmann believes it is a marsh gas, of the silicun series.

Spontaneous Combustron-A shaft has heen suuk on the Home Ledge (copper) adjacent to the Alabaster Cave, in E1 Dorado county, to the depth of sixty feet, where a vein of copper sulphurets has been struck. When these sulphurets are raised to the surface, and exposed in the upper air about twenty-four hours combustion ensues, and the residuum resembles lava. The cause of the combustion has not been yet ascertained. The matter will be investigated by Prof. Whitwey, state Guolugist.

Copper from the South.- Some very rich samples of copper ore from the recently discovered mines in the liill Williams' Fork Distnct, New Mexico, were brought to this city by parties who recently arrived on the Steamer Senator.

Santa Clara College.- We bave received the "Prospectus" of this Collegiate Insfitute, containing a Catalogue of the Officers and Students for the year 1862-63; aloo the exercises of the 121 h anuual Commencement and the distribution of Premiums. The pamphlet also contaius two beautiful lithographic fiews of the College.

St. Ignatius College.-The annual commencement of St Igoatius College, of this city, takes place to-morrow. We acknowledge the reception of an invitation to be present at the exercises.

The Height of Vandalism,-Some miserable wretch, has cut the stalk from the beautiful flowering shrub in the Custrom Homse Park. Mr. Sanford has offered a reward of $\$ 50$, for the detection of the scoundrel.

THE MLNING SHARE MARKET.
The material improvemeut in the Mining Share Market, noted in our last issue, has, during the last six days, culmitrated in a perfect fever of excitement. The contivued developments in the Gould \& Curry, and the strike in the Hals \& Norercss, has produced a most remarkable effect upou the shares of all companies on or near the line of the Comstock Ledge.
Gould \& Curry advanced to $\$ 6,300$ early in the week, but subsequently declined to the same figure with which it clo ed the week previous- $\$ 6,050$. A dividend of $\$ 150$ per foot was declared on liritay $\$ 60,000$ or $\$ 50$ por fout being carried forward to the coming month. The total amuont of dividends was $\$ 180000$. There is good reason for believing that the total earnings of this Coupany, for the coming year, over and above expen-es, will exceed two and a half millions of dollurs. 'The entire axtent of the Company's ground is only 1200 ficet.
Ophir shares have been largely in demand during the week; 498 shares having chavged hands at from $\$ 2430$ @ $\$ 2700$ per foot.
Savage has fully maintained its extraordinary advance of last week. The trunsactions in these shares have not been large, owing to the firmness of holders. This Company is now taking out large amounts of bullion, and a dividend is confidently expected the coming montl. The receipts, for the present mouth, from the mine, are estimatea at $\$ 50,000$.
Hale \& Norcross has attracted consiulerable attention, at prices greatly fluctuating. 111 shares bave changed hands at \$1600@\$2250. The market for the week opened at $\$ 1600$, advanced to. $\$ 2050$, receded to 1700 , again advanced to $\$ 2250$, and finally closed the week at $\$ 2100$.
Daney has also attracted considerable attention,-with large transactions, at rates, quite uniform for an excitable market. Shares to the number of 313 have changed handa at $\$ 3521 / 2 @ \$ 365$.

Chollar has been sought for at rates ranging from $\$ 740$ @ $\$ 1000$. These shares experienced some little fuctuation' but closed firm at $\$ 900$. The recent assessment of $\$ 72$ per foot has been made to effect a thorough opening of the cluim. There is no apparent reason why this claim should not prove, equally as valuable as the arerage of other griund ou the Comstock lead.
Potosi has materially improved, though with limited transactions. It closed firm at $\$ 700$, an advance of $\$ 2001$ over last week's quotations. 'The prospect of this mine is said to be highly satisfactory.
Wide West has seriously declined ; opened at $\$ 180$ and fell to $\$ 115$, with a weak market, at the close. Silver Hill, transactions limited, at ${ }^{\text {Win}} 35$. Antelope, $\$ 225$. Utah, $\$ 85$. Bamboo, but little dealt in. Pond, fell to $\$ 20$.
From Humboldt we learn that prospecting is being done, generally with encouraging results, and extensive work is being performed on many of the old and recent discoveries. We have a table of Humbuldt Mining Stocks, in course of preparation, which we hope to be able to give sood.

The last number of the Humboldt Register says that work is progressing finely on most of the old locations. The Manitawoc, Peru, Monitor, Sargent, Delirio, National, Alto, etc., all holding at good figures; and sales this week to thirty or forty thousand dollars. The highest offer we have heard for any was sixty dollars a share for Logan, on the Manitowoe ledge. Fall's mill has been running this week on rock from the Natioual. Amalgamating now, and will commence immediately on Mars. No figuics.

## the COPPER intereat.

There is no apparent abatement in the Copper interest. Shipments are constantly being sent folward frum the Calaveras and Amador mines.
Napoleon is now shipping an average of 6 tons per day, besides accumulating large quantities of 2 nd and 3 d quality ore for concentration. The stock of this company is held at $p$ rices largely in advance of buyers views. We notice no tran-actions during the week.
The Josaphine is driving up a working adit to their vein, which they hope to reach duriug the coming month. The work is being prosecuted night and day.
New and important developments are being made in that
portion of the Newton District，udjacent to the Mokelumne river on the south，and near Cimpo Seco．A new tuwn has heen laid out there，called C＇uper Centre．The princi－ pul Company is known as the Bull Run，which has a very promising ledge．They are now raising ore，huving recently put up hoiating works，assorting sheds，etc．Quite a num－ ber of other Companies are operating in the same neigh－ borhood，from wilom we expect to hear guod reports in due time．

The Newton Company has commenced sinking a now ehaft．in urder to secure a proper degrae of ventilation for their mise．Work has heen temporarily suspended in the ald workitg by reason of foul air．

Knowledge of the Copper belt is being constanty ex－ tendid northward．We hear of late and important devel－ opmente in Yuba，and Butte connties．An impertant dis－ covery of Bluo Malachitu has recently been made near Oro－ ville，which is pronounced by competent judges，in this city， as presenting the most prumising indications yet developed in the way of Copp r Mining．

The Finreka Co．，Greeri Ledgo，Nevada County，has ten tons of ore now on the way to this city，the first shipment from that comoty．

Considerable attention is beginning to be directed to Cop－ per on the Eastern Slope．That region is undeubtedly rich in this mineral，and the prospect of the early establishment of railroud commun＇cation across the mountains，gives en－ couragement to immediate and throrough development of these mines，bitherto considered valueless for preseat work－

## ESMERALDA CORRESPONDENCE．

The varinus Ledges in Esmeralda District are being more thoroughly worked than at any period since the discovery of the mines－the resnlt of which has caused considerable ac－ tiv ty in slocks the past week．

The Red，White ard Blue，on Silver Hill，is turning out very rich rock．The old shaft is down to a depth of to fr． A sacond shaft has been sunk to a depth of 40 feet and the ledge is now over 8 feet wide．About 30 tons of rock has been taken out ready for crushing，which will pay from $\$ 40$ to $\$ 60$ per ton－the work is being vigorously prosecuted and from 8 to 10 tons per day is being taken out．
The Clan－Alpine on Last Chance Hill is yielding rich rock． The shaft is duwn to a depth of 30 feet and the ledge is 4 feet wide．About fifteen tons of rock have been taken out， Which pays over $\$ 100$ per ton．

The last crushing from the＂Ural＂yielded 852 ounces．
Fourleen tons from the Midnight paid $\$ 1950$ ．
A crushing of 35 tons from the＂Western Summit＂yield－ ed $\$ 2400$ ．

Twenty－two tons from the＂Crockett＂yielded $\$ 3200$ ．
The last crushing of thirteen tons from the＂Broderie＂ paid $\$ 1350$ ．

There is more rock being taken out at the present time Ithan can be crushed by the various Mills in the District．

Subscribe．－Are you a miner and not a subscriber to the Mining and Scientiric Press？If so，you are an annual luser of many times the price of a year＇s subscription，par－ iticulurly if you are gngaged in cquartz mining．The same amount of practical inforuation，important to miners and mechanics，which is contained in a volume of the Press ${ }^{+}$can－ not be bought fron the shelves of any bookstore in the coun－ try for the price of several year＇s subscription，Do you ever
send a paper to the＂Old Folks at Home？＂If so，and you send a paper to the＂Old Folks at Home？＂If so，and you
desire to send important information and valuable reading matter，you can find no paper that will be read with so much eagerness by them，or one that will convey to them so full an account of the real industry of the country as the Min－ ing and Scientific Press．We invite all to send us their names and four dollars，or two dollars for six months，and become patrons of the only mining puper printed on the Pa － cific coast．Those who receive a paper with this paragraph marked may understand that it is sent to them for examina－ tion，and with the bope that it may so for meet with their approval as to warrant their subscribing for it at once．It is
not our usual custom to reccive a subscriber for less than not our usual custom to receive a subscriber for less than six months；but inasmuch as we are anxious to introduce the paper where it is not now known，we will，for the pres－ ent，send the Press for three months even，on the recelpt of ove dollar，in coin or staups．It is our belief that no．one will wish to discontue the paper after being a constant read or of it for even that short perioa．

ESMERALDA STOCK LIST．
［Corrected for the Mining and Scloutile Press，June 22，1882．］

Considerable activity has been manifested in the Stock Market of Esmeralda District，the past few duys，and a num－ ber of claims have changed hands at an advanced fgure．
Ten thousand five hundred ounces（ $10,500 \mathrm{oz}$ ．）of hullion has been shipped from this District within the past fonr days and the amount in preparation for the next ten days will far exceed that figure．

## THEATRICALS．

McGuire＇s Opera House．At this place the week has been chiefly occupied with East Lynu，one of those intrnse－ Iy sensational pieces，which at times arrest and absorb tho public interest．Considering the painful moral of the play，it may，perbaps，be considered an indication of the improved taste of our citizens，to find the house crowded ev－ ery night to its utmost capacity．Apart from the merits of the piece，however，the performance has been excellent，all exerting themselves to justify the patronage，so liberally ex－ tended by the intelligence and respectability of the city． So far as we catch the expression of public opinion，it is one of entire satisfaction，particularly with Mrs．Hayne，Mrs． Perry，Mrs．Mowbray，Messrs Taylor，Anderson，Mayo and Thorne．No doubt the Management are equally satisfied． On Friday，Mayo，and Saturday，Mrsi．Hayne，took their bea－ efits．
Eurera．－At this little temple of fun，there has been nothing especially new since our last issue，except the bur－ lesque Opera of＂Oh Hush，＂in which the peculiar talents of the troupe appear to advantage．The singing and perfor－ mance，as usual，have been good，and the house crowded to excess．We shall endeavor to aid this success；for the min－ strels，in every respect，deserve the patronage they enjoy．
Dashaway Hall．－Do not forget the Histrionic and the Ball at this place to－night．Let those who can afford a dol－ lar，go by all means，and we warrant they will not be disap－ pointed．

IIINING \& SCIENTIFIC PRESS. THE ONIT MHNING, MECHANICL AND

SCIENTIFIG PAPER ON THIS
THIRD YEAR! VOLUME VI-NEW SCRIES!
A new volume of this extensively circulated paper commenced sept. 11,1862 . It is intonded that overy
number shall bo replete with information concerning number shall bo replete with information concerning fining, Scientitic, Mechanical and Industrial pursuits,
together with several original engraviugs, of new invent tions, etc., preparod expressly for its columas.
This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and commerce, and 20y general iuformation that may be of in prest to the reader; and it is the intention of the proprictor to spare no pnine or expense in making it cegual
in interest and valuable information to any paper yet published

## The Mining Interest!

Will find it of gruat ralue, as it will contain all the ows appertainmg to Mining, the prices aod sales of Mining Stocks, new inventions of Machinery adap ed to that
purpose, and of everything generally that may be of serviceto the Miner

## The Inventor

Will ind it an excellent medium for the purpose of briuging his invention into notice, of ascertaining the progress of invention in this and other cmuntrjes, and also of recciving any information that may be pecer ary in obtaining his patunt, the proprivtnres haring had
great expericnce as Pntent Agents, together with facilities at Wasbiugton that enable them to outajn Patentu

The Mechanic and Manufacturer ! Will be greatly beucfited by its perosal, as its columps will from time to time contain origiaal engrav-
ings of new machines and inventions, together with a large amount of reading matter appertaning therelo.
We are constantle receiving the best scientific journals from all quarters, from which we shall conthue to extract whatevor may be of benefit or interest to To Chemists, Architects and Millwrights. This journal will bo invaluable. All ncw discoreries in Chemistry will be given, and a large amount of infor-
mation of great service to Architeets and Millwrights will be found in our columus. The Farmers and Planters will not be neglected, engravings will be given of
agricultural implements, and the farming interest generally will be amply discussed.

## CENTRIFUGAL QUARTZ CRUSHER.

The annexed cut represents the quartz crusher, of which e have frequently spoken, as in use at Pike's Peak, where appears to be known as the "Young America Quartz Crush-

In the proprietor's Circular from which wi? gather the Howing description, it is called "The Centrifugal Quarta rusher." It is employd at Pike's Peak in connection ith Keith's Desulpherizing Process, for which it is pecutrly adapted.
It is claimed that this mill is capable of crushing a larger hount of material, with a less expenditure of power, than by other mill in use. It is said to be as wellwdapted to the inding $8 f$ all kınds of grain, as it is to the reduction of partz rock. The engraving fully represents all the parts, a prition of the left side being broken away to exhibit the ms, shows its inside structure. The shell is three feet in ametor, and five inches wide; a steel shaft passes through O centre, armed with six fans or arms, reaching pearly to e periphery or rim. which is corrugated on its inner side. The material to be crushed is thrown in alongside the shalt d las its exit on the opposite side, through the pipe there - presented. Each piece of ore or other material, as receiv, is stricken by the arms, and rendered dust fine, in hich condition it is thrown out at the tube on the opposite lo by their action as a centrifugal blower. The fineness of product, and the efficiency of the mill, depend entirely upthe ve'ocity with which it is moved, aud the position of the po for the exit of the ground naterial. At low velocity it an excellent rice and coftee huiler, and at high velocities ehardest gold quartz can be ground to an impalpable wder.
analybis of the action of the centrifugal quartz crubier.
For a clear understanding of the action of this instrument will be neccssary to analyse some of the nataral laws fich are broughtinto requisition during its use.
The difference between absolute momentum and contind force, is well understood; but when the momentum is rried up to unusual speeds, it 18 clamed that new acas and functions are developed, which are not to be found the trip hammer or other asual methods of exercisiag mopntam. Suppose a piece of gold quartz to be thrown inthe atmosphere, and during its descent be stricken by a dge hammer, traveling at the rate of twenty thcusand et por minute; it is claimed that the action will not be prely to break the gold quartz into fragments, but to surse the cobesive power of the mass, and thus, for an inint, of time, to do away with that property, rendering the iss representing smoke of finest possible division of math

And this elain we think can be rendered uuderstandle by a clear illustration of what constitutes cohesion, d also by a development of a new function, which nay be us expressed.
A body in motion, is said, in common mechanical parlance, have a power, as a projectile, equal to its weight multied by its velocity." It may be said, with equal truth, that 3 harducss of a body in motion is equal to its hardness Atiplied by its velocity. Thus, it is well kuown, that a

Howell's Patent Centrifugal Quartz Crusher,

tallow candle may be thrown from a gun through an inch plank, while it is well known that a candle is much softer than a board. It is also well known, that a disc of soft iron rapidly revolved, will cut into a bar of steel; indeed, any substance, which from its surroundings and peculiar configuration, can be passed with great velocity, is increased in relative hardness. Let us admit, then, that with the Centrifugal Quartz Crusher the moving arms may be made to reach the velocity clained as necessary to surprise cohesion. If we examine cohesion as a property in matter varying in different substances, and suppo=e it to arise from the attraction of particles for each other, rather than from a hooklike torm of particles interlacing each other, we shall find no difficulty iu comprehending the immense force necessary to sever it. Thus, a cubic inch of steel, or an inch square of steel, would be more proper in this case, exercises tension at the rate of $90,000 \mathrm{lbs}$. when applied as continued force, and not as a momentum. If we recollect the rale that attraction is inversely as the squares of the distauces, and then admitting that with an ordinary magnet, the attraction exercised upon the keep, at the distance of one inch, is 1 fb , then at half an inch it will be 4 thas, at a quarter of an juch 16 ths, at an cighth of an inch 64 ths, at the sixteenth of an inch 256 lbs , at the thirty-second of an inch the square inverse of that number, and so on at the same ratio, until at the point which is supposed to be actually in contact, it is no longer curious that the inch area should sustan 90,000 this, but rather that any amount of force which could be practically applied would draw it asunder, and were it not for that film. af resistance described by Newton, it could not be separated.
Wheu a surface is attacked by absolute momeutum, this filin of resistance may be perceived; and although in or
dinary use two billiard balls do not really touch each other and therefore the polish is not destroyed and the balls are not split, still with an increased amount of momentum both these effects will occur. As an illustration, suppose a polished anvil have placed upon it a piece of gold leaf, and you sh uld put upon this any amount of continued force, it would not cause any analgamation, or other connection botween the gold and the anvil, and after removing the impinging matter the gold leaf might he blown off; but if the gold leaf be stricken by a polished hammer, so as to develop momentum at the point of contact, that point will be found to be permanently gilt, and if we scrape off the surface to three times the thickness of the gold leaf, we shall find gold imbuing the metal. This is a well known fact, and fuirly illustrates that by absolute momentum the film of resistence may be pierced, and certain metals may be torced into each other.
Now in the use of the arms of this machine, we would clam that aboolute momentum, and not continued force, is the form in which all power is developed at the speed proposed by the inventor. This momentum is sufficient, yot only to do away with the film of resistance at the point of contact, but to surprise the cohesion of particles, 80 that instead of breaking the mass into many pieces, it absolyteIs divides it into its ultimate particles: and there is a speed at which chalcedony and gold quartz, may be crushed by this machine, so that the powder resulting is so fine, that when rubbed hetween the fingers it is soft like velvet, exhibiting ne grit or other proof of crystaline or other continuous structure ; nor will the machine itself be abraided during their action, for so great is the speed of the arms giving the momentum, that their hardness, as before explained, is increased in the same ratio. Even the surface of these caitings will not be abraided, while the substances they are irmpinged upon will be delivered from the machine in this finely divided condition.

All former methods of crushing gold quartz have failed in exhibiting all the gold, from the absence of an entire divisior, mechanicaliy, of the particles. This may be understood : a piece of pure gold drawn aeross the surface of a hone leaves a yellow mark, and in many kinds of gold ores this graphitic-like mark is to be found pereolating the mass, and when divided by washing, despite all methods yet pursued, it passes off with the water. Indeed, this finelydivided gold will float a manth on the surface of water, without becoming wet on the upper side of the particle, or in other words, without sinking', and it is therefore lost. Many specimens of pold quartz contain a much larger amount of gold than can be separated from them after what is usually called thorough grinding, by washing, and the same defects from the same reasons, oceur during the attempted amalgamatinn. When the quarta, however, is crushed by this machine, at its greatest velocity of aption, every graphitic indication of gold is caused to appear upon the surface of particles, and therefore it may be removed by ordinary amalgamation. We have segn ores crushed with this machine, which would yield a larger per centage of gold beyou d the amount obtained by the usual methods, than the amount so obtained.

Notes of a Trip to Slate Range via Los Angesos and El Paso.-No. 4.
APRLL 25th. The EI Paso range of mountains, for which the District is named, is a spur from the southern termination of the Sierra Nevadas, ruauing north easterly abcut 25 miles from Red Rock Cañon, near Cane Springs, through which the road leads off to Owens Lake country, Coso, Mono and Esmeralda mining Districts. Another spur of burnt mountains commencing at the same Ganon, runs north-westerly to Walker's Pass, about 35 miles. The El Paso Range seems to contain rich metals, throughout its whole length, exceptat a point about 3 miles north of Mesquit Springs, where the hills appear to be entirely burved to ashes. Some gold has been found in these hills, but no defined ledges. the mineralis and mineral veins.
The minerals found here are silver, copper, galena, and some gold ; of which the Tucker Lode, on Gold Hill presents, thus far, the best indications, which are bright pieces of native metal seen all through the rock. The range seems to terminate in a mountain called Laurel Hill, which contains more rich lodes than any other in the District. The Manzannilla, Milliken, Laurel No. 1 and 2, and Ophir Lodes are located there. Thus far but very little work has been done in the District; no working men have come in. All are prospectors and locators. Many of the lodes show very rich croppings, and soon they will be further developed by sinking shafts, and tunnels, to find their condition 25 to 50 feet below the surface.
The lodes now located are generally boldly defined, some of them rising 5 to 8 feet above the surface, showing a continuons line of mineral for a long distance.

> ORE en route FOR SAN francisco.

A train of 30 pack-mules passed, from Slate Range, to-day, loaded with An'rim rock bound for San Francisco for reduction. The teamsters all say that this point may be considered the half-way station from Los Angeles to Slate Range, as from this Spring no leed or water can be found, together, to keep up the condition of the cattle. Teamsiters offer to contract for freight to this place at one half the rate to Slate Range, although the distance from here to Slate Range, is only 50 miles; while to Los Angeles it is nearly 150 miles.

APRL 28th. There is no difficulty in finding leads here, as they crop out on every hill and gulch. We shall locate some of them, and as soon as our tools arrive, develop them, to determine whether they will pay to work and ship to the city, at a cost of about $\$ 125$ per ton.
a thunder storm.
May 1st. A heavy thunder storm, with little rain, passed along the summit of the monntains, following the hill around to the East and then South Easterly on a spar into the desert about 40 miles. It was very interesting to one who had not heard the sound for more than 13 years.

May 4th. To-day we associated with a couple of prospectors, who have a pack-mule, and one of our party left with them for a week's trip to prospect Laurel Hill, from which some specimens of great value have come into camp.

## the ill fated ada hancocg.

Report came in to day of the terrible accident occurring to the steamer Ada Hancock, on the 27th ult. This strikes home to our communiy with great force as we were intimately acquainted with most of those killed and some of them are associated in this mining enterprise, and were here only a few days since in full health.

May 5th. Made out and posted notices of a meeting of miners, for the 8 tin of June, to alter and amend the District Laws.
A party of 20 or more soldiers have arrived at Can Springs as escort to a train conveping Government stores to Owens Lake Country. They remain at the Springs till a former train returns to that point under guard and then return the way they came.

## prospegtors and laborers arriving.

Oar Recorder, J. Narboe, and others who left under the Indian excitement, have returned and are intending to progress vigorously with the work of developing the clains.
11th. Two Gornish miners came in to-day with a Visalia party. Messrs Turner, Cobb and Rheinstine, to open claims and test their value. Good for us!

Messrs. P. Banaing of New San Pedro and M. Keller of Los Angeles, have sent out a working party of about 20 greasors and four or five white men, to work 15 or 20 claims, held by the original discoverers of this District, Messrs. Milliken, Narboe and Warner. Most of these claims are in Montville Cañon, Copper Hill and Basin Silver Hill and Gold Hill: They reserve their Laurel Hill leads for the present, I am told. Our population is now about fifty, including greasers.
15th. The greasers are leaving, as the work is very hard and the pay small-about $\$ 25$ per month and found. The climbing up to their work in the morning is what wears them out, as the camp must be located at the base where the water is found.
17th. Messrs. Keller \& Co. are here again to look over the District and decide in regard to sending out more help.
Wednesday, May 20th. For nearly three weeks, I have been almost alone, acting as camp keeper for three camps, clo:e by, while all hands are busy among the rich lodes of Laurel Hill, 15 miles sway.

I will sead forward by first opportunity this fourth paper. and theo others as occasion offers.
Report has come in of Mr. Whitmore and siz horses mussing from Indian wells ranch, supposed to have been taken by Indians. Two horses were shot and left on the ground.
1 will make up a list of what is wanted for a prospecting trip like this, in my next letter.
C. W. T.

## SUB MARINE EXPLORATIONS.

It is only within a few centuries that the inventive genius of man has been enabled to so far cope with the ordinary laws of Nature, as to remain for any length of time beneath the surface of the water. Curiosity at first prompted te such attempts, and subsequently the wants of man became powerful incentives to effurts in this direction The limited powers of endurance on the part of the simple diver, soon called into action the inventive ingenuity of man to supply mechanical aids for such bazardous and laborious undertakings. Inverted wooden tubs, cumbrous with pendant weights and overhanging tackle, gradually gave way to metalic hemispheres, with various contrivances for supplying fresh air. Dr. Halley and Mr. Phipps, in the latter part of the 16 th century, made various important improvements to the "Diving Bell," which greatly increased its practicability. The Doctor invented a very useful contrivance by which he was enabled to go out and move around upon terra firma at the bottom of the water. This last invention doubtless suggested the "Submarine Armor" which has been so popular for the pust twenty years, and which has actually accomplished much in bringing to the surface sunken treasure, etc., and in conducting various other submarine operations.
Important as were the results achieved by these appliances in the hands of daring men, from the time of their earliest introduction up to near the close of the last decade, it was still acknowledged that much remained to be done to bring the diving bell to anything like a reasonable standard of excellence. The chief obstacles in the way of their advantageous application was the cumbersome machinery unavoidably attached to them, for forcing air, eto., and the necessity of sustaining them by dericks or cranes. The former objection was a most serious one and extremely hazardous, as the lives of the divers of ien depended upou very slender and uncertain appliances; while the necessity of being sustained by cranes rendered their employment upon floating sapports almost useless from their constant up and down motion, where the water is agitated by any considerable wave or swell. The great danger to life, and terrible effect upon the system, attendent upon the employment of the submarine armor is well known to all conversant with submarine operations. The simple statement of the fact that in the use of the "armor" at a depith of 100 feet, every plunge of the air pump is equivalent to a blow nearly equal to four pounds upon each square inch of the body of the operator, is sufficient evideuce of the endurance required in in its use. No organization can successfully resist the exhausting effects of such terrible and continuous shocks for aay considerable length of time.

The Diving Bell and Submarine Armor, haye had their day. They have beep weighed in the balance and found wanting, and the world is now indebted to an American In-
ventor for what appears to be the perfection of mechanic: appliances to submarine operations, whether for descendit to the bottom, remaining there at will, then ascending the sur!ace; or moving aloug beneath the surface, at a gree er or less depth as may be desired.
The invention to which we now refer was patent, by Professor Ryfrson, of Nevt York, about three yea since, and was first successfully employed in removing t] obstructions near Hurl Gate, in New York Harbor. Itw then pronounced by the New York papers as the ne $p l$ ultra in the way of a diving apparatus, and that opime has never been qualified since.
We have now before us a sketch of this ingenious pie of mechanism with a description of its parts from which r . condense :-

It is formed of two very substantial wrought-iron cylinde one of which is contained with.n the other. The space 1 tween them forms a compressed air chamber.
The inner cylinder is divided into two compartments, whi can be completely separated frön each other by closing 1 intervening man-hule whenever separation is necessary. Co munications are maintained between these compa ments and the compressed air-chatnber by valves, or sti cocks. At the base of the machine there is another compe ment completely surrounding it called the ballast-chamt It communirates both with the compressed air-chan! and the external water, by means of pipes and stop-coc Into this ballast-chamber water or air may be admitteri pleasure by the workmen within the Bell, and the mach call ascend or decend; and the equilibrium is so nicely adj: ted tuat it is absolutely impossible to upset the machine er. when it may rest only on one point of a rock. The ai, condenced into tne compressed air-chamber at first, by ordinary force-pump, to the extent required previoas to decent. The machine is now perfectly bouyant, buthy ingenious arrangement, after the hatch is secured, wat admitted into the ballast-chamber; the machine then si and after it has reached the bottom it remains ready for proposed work. This machine having reached the bott to be explored or acted on, the man-hole between the $t$ compartments is opened, and the workmen begin their o ations in the lower working chamber, and can contir. them without interruption, eveu for daye, either in lay foundations of breakwaters, sea-walls, piers, in raising su. en vessels, treasure or anything valuable in them, in div for pearls, and sponge. It has been suggested by experien persons that this Bell is preeminently fitted for the exple tion of the bottom of auriferous rivers in every part of ; world. In short, this machine is applicable to every bray of submarine exploration. The light is partialy admitted bulls-eyes. Candles are required, and the combustion these, together with the respiration and transpiration of confined workmen, in due time vitiate the air contained in chambers. 'To remove this air withont external appliar was the great problem to be solved, and Mr. Ryerson triumphantly done so. By a very simple expedient the : is restored to perfect purity in a few minutes, not as in I previous machines by driving fresh air from above, but, driving (by means of a small forcing pump within the crine) through a very minulely drilled resette, resembl that of a common watering-pot, water from without, in form of very fine spray or mist for some minutes.
By this simple and easy process, the carbonic acid and er noxious gases, formed by combustion \&ce, disappeari the previously vitiated air recovers its oxyoen, and is for (as determined by a very careful analysis, given in anot column,) to hold an excess of five per cent. more oxy? than that contained in the ordinary atmosphere Thus erson's machine can ascend and descend, always maint. ing an equlibrime, purify its vitiated air without exter connection or assistance, and is thus placed at the head all submarine explorers.
Poison Antidote-Sweet Oil.-Says a farmer: "Il 1 now over twenty years since I learned that sweet oil wid cure the bite of a rattlesnake, not knowing that it wr $\ddagger$ cure any other poison. Practice, observation and expi, ence have taught me that it will cure poison of any $k$ both in man and beast. I think no farmer should be out a bottle of it in the house. The patient must tak a spoonful internally, and bathe the wonnd for a cure. cure a horse it requires eight times as much as it dc'a man. Here let me tell of one of the most extreme casif snake-bite in this neighborhood, eleven years ago this mer, where the case had been over thirty days' standing, dd the patient had been given up by his physicians. I hea of it, carried the oil, gave him one spoonful, and a cure as created. It is an antidote for ansenic and strychnine. It will cure bloat in cattle caused by eating too freely of 1 ish clover ; it will cure sting of bees, spiders, or other inse $\beta$; and it will also cure persons who have been poisened by 10 ivy vine."

## THE CENTRIFUGAL QUARTZ CRUSHER.

The great interest manifested, and mumerous eaquiries made, hy letter and otherwise, with regard to this Crusher, have induced us to give an illustration of the machine, on our first page, accompanied with a description, and a very full analysis of the philosophy of its operation. With regard to its capacity or practicability we know nothing except by hoarsay, and that information, together with our authority, we have fully communicated in the columns of the Press.
From the fact of its continued use at Pike's Peak, we are ioclined to think well of it. The philosophy of its operation is evidently suand. A most important condition attending its use is, what appears to be a act, that it reduces the quartz to an impalpable powder, at one operation. A further important consideration is that it works the ore $d r y$. The latter we consider of great importance, as we believe it is nuw pretty generally admitted that a very large percentage of the precious metal-, especially in gold crushing, is invariably carried off with the water, in spite of the most carfully managed settling vats. We shall cheerfully communicate to the public any facts with regard to the actual results of this machine, which may reach us through any reliable channel.
Lithoarapher.-Mining Companies, and others, in want of any kind of Lithograph Work, will do well to call upon R. W. Fisubourne, at 529 Clay St. Some of the finest and best desigued Certificates of Mining Stock we have ever seen are from his place. See his advertisement.

The Mary L. Gardiner.-We have received many enquires with regard to the "Mary L. Gardiner" Company, of Esmeralda. We know nothing more of it than we find in our Esmeralda Letters. We presume our correspondent writes from knowledge obtained up.n the ground, although in the absence of any other advices, holders, in this city, do not credit the reported "strike."
Skedaddle.-This word is said to be pure Irish. The Irish sgedad means scattered; sgedad ol means all pcattered. An old version of the Irish New Testament contains this passage: "For it ie written, I will smite the shepherd and the sheep of the flock shall be sgedad-ol." The word was probably first used in our army by an Irishman, and, being looked upon as particularly felicitous, was at once adopted.

Physiology.-Old Dr. Pearson, of London, in lecturing upon the stomach, observed that this organ had no power over substances endued with vitality, and that this circumstance accounted for the fact of the Prophet Jonah having remained undigested in the stomach of the whale for three days and three nights! This is a step further than theology ever went.
Medical Press.-We have received the July number of the San Francisco Medical Press. It contains much that is. original and interesting, from able writers.

THE MINERS' taboratort.-NO. X.

## MORE ABOUT SULPEURETS.

Mr. Editor:-The following account of some Norwegian processes, may be of interest to your readers, as a contribution to the method of working Sulphurets. I only regret that in one case I am u:lable to send you the results of comparative experimeuts.

The first method is due to M. Aas, of Thydal. Its economy is based on the production of what he terms spongy iron, for the parpose of reduciug copper from the residues of furnacing. The ores coutain but 2 to 3 per cent. of copper; the remainder is irou pyrites. The "harat pyrites" are lixiviated to extract the sulphate of copper, and mixed with a small quantity of small coal and the reduction of the iron is effected with the hot gases from a furnace, of the kind used for generatiug combustible gases, and there khown as "gas geverators." The heat is below the melting point of iron, and, for such temperature, these gases are very economical. It is obvious that this spougy iron is much cheaper than cast iron, and is in a form most excellently adapted to the chemical process of extracting the copper by substitation in the vitriol. The difficulty of furnacing pyrites in the way indicated renders it doubtful how far this is practical for working copper; but I can speak to the facility with which iron may be manufactured in reverberatories from such sponge-I must defer the remainder of this communication till you have more room for

San Francisco, July 1st, 1863.
["A Poor Chemist" is always welcome to our columns, and will never be crowded for "room."]

## SPECLAL NOTICE.

Some weeks since we forwarded blank receipts to such of our subscribers as are in arrears for their subscriptions. Some have promptly answered by remittances of the amounts due; others have notified as of sp cial contracts with our predecessor, or of full payments made to him and not credited on our books. Where payments have thus been made, we have, in every instance, allowed them. There are quite a namber, however, who have returned no reply to the bills which have been sent out. We trust all such will respond inme diately upon seeing this notice. If payments have been made, we wish to be notified of the fact, so that due credit can be given; and if there are any to whom the paper is now sent who do not wish to continue it or do not intend to pay their subscription, ze hope they will notify us of the fact so that we.may discontinue seuding papers to them. We do not wish to crowd the paper upon any man. All the names upon our list have been placed there, as subscribers, upon what we have deemed good authority. If any party, not considering himself a subscriber and in arrears, has received a bill for subsciption, he will confer a favor by notifying us immediately of the fact. Postmasters are also reminded of their duty to return a paper that is not called for, etc.

## OUR MINING DIRECTORY-SPECLAL NOTICE.

The large call upon us for space in our Mining Directory, compells us to decline to receive the names of all Companies who are not subseribers to the Mining and Scientific Press, either in their Corporate Capacity or by their Secretaries. We have removed the names of several Companies from our list, this week, for the above reason, and have been compelled to decline to receive the names of several others, for the same reason. We trust that our mining friends will fully agree with as in the opinion that no one is a proper person to act as Secretary of a Mining Company, who declines or neglects to take the only Mining paper in the State, and to pay for the same.

The Teacher.- The first number of this journal hasjust been issued. A journal of this kind seems to us, almost indispensible to the growth and prosperity of our schools.

The Pacific Monthiy.-This magazine has again made its appearance on our table. We congratulate the proprietors of this periodical upon the happy faculty which they possess, to please their readers.

## RYERSON'S SUBMARINE EXPLORER.

We have devoted considerable space in another portion of the paper to a brief review of the history and progress of submarine machines, and given a somewhat minute description of "Ryerson's Submarine Explorer," the latest improvement in this direction. The chief feature of this invention, and the principle upon which $i$ is based is the fact discovered by Prof. Ryerson that duriug the passage of spray through air vitiated with carbonic acid, the air is not only restored to its normal condition and fitness for sustaining both combustion aud respiration, but that there is actually an excess of oxygen in air after this treatment. Prof. Ryerson, to account for this valuable phenomenon, has made calculations based up:u the analyses of the late Dr. Deck, which lead him to the conclusion that a decomposition of the carbonic acid is instantaneously effected at the same time. Prof. Ryerson has informed us that the same rffect is produced with fresh as with salt water and this in connection with the subjoined analyses seems to preclade the passibility of any other supposition.

## [Copy.]

Analeticat, Laboratory and Oprice of Consulting Chemists,
No. 18 Exchange Place, near Hanover st., N. Y.
I have analyzed samples of air collected from Ryerson's Submarine Explorer, by myself, as in the margin, and certify it to contain as under.
After the air had been breathed for over an hour by three full grown men, at twenty feet under water, with a pressure of one and a have atmosphere ( $11 / 2$ ), and candles failing and respiration laborious, 100 cubic inches measure contained:

Weight of 100 cubic inches at 60 deg., 33.060 grains.
There were traces of sulphur, ammonia and chlorine. The air was so impregnated with carbonic acid gas as to render lime water rapidly turbid.
When the fine pump spray had been playing from three to five minutes through the chambers, another sample was taken, and analysis showed 100 cubic inches measure.

| Oxygen | 22.00 |
| :---: | :---: |
| Nitrogen | 75.00 |
| Watery vapor. | 285 |
| Carbonic acid gas. | 0.15 |

## Total. . . . . . . . . . . . . . . . . . . . . . . 100.00

Weight of 31 cubic inches at 60 deg.. 31.025 grains.
There were traces of chlorine, (more than before,) no sulphur, no ammonia, no turbidity in lime water, and the breathing free and agreeable.
On my second descent in the Explorer, when I had every opportunity of observing its workings and took the accompanying samples for analysis, remaining over three hours without the slightest inconvenience, no air whatever was taken in the interior from the surface or from the compressed air chamber, and 1 have no hesitation in affirming that we could have remained twenty-four hours below, the air being purified and revived by the use of the spray pump.

Isatah Deck, M. D.,
Analytical and Consulting Chemist
The samples were obtained by Dr. Deck in the usual way, i. e. by taking bottles of water down in the apparatus and emptying them when it was desired to collect a purtion of the air fur the analysis. The result shows that after the application of the spray the air was purer than the ordinary atmosphere.

Again, under date of September 21, 1859, nearly a year subsequent to the date of the above, the Doctor gave the following as the result of a second analysis :-
"I have made an analytical examinat:on of two or more samples of air, pure and impure, collected from Ryerson's
submarine explorer, in the presedee of six persons who desubmarine explorer, in the preseuce of six persons who de-
scended in it and certify the results to be as follows : scended in it and certify the results to be as follows :
After the air had been so far breathed by the above persons, without any connection or sapply of air from the surface, so that the candles went out and breathing became oppressive, at contained in 100 barts:

When the sprap-pump had been playid for ahout ten minutes, and the candles and breathing freshened, it containe d in 100 parts:
Oxygen..
Carbonic 26.00
.1 .50

Carmonic Acid 1.50
Total. .100 .00
By these results the efficacy of the spray-pump in reviving
he impure air, and doing all that is claimed for it, is tulthe impure air, and doing all that is claimed for it, is onggen $t$ an the impure, and $\overline{5}$ per cent. more than the ordinary atmosphere.
It will readily be perceived that the principle upon which this Submarine Expl.rer-is founded, admits of its applicar tion in valious ways. By varying its form, we have a conplete Subrarine boat, capable of sustaining itself at any desirable point beneath the surface, without any connection with the upper uir, and with unrestricted powers of locomotion, as capable of being directed by compass in its subnarine navigation, as any floating cralt would be iu a dark vight, on an enemy's coast, where the ligh's were ext'nguished. In this form, it may be rendered a most powerful submarine protection for harbors.
Again, as a diving bell, it must certainly, prove a most admirable piece of machinery for Pearl Fishing, as, by its assistauce, the diver may go down to the bottom of the sea, and, where it is smooth work with as much facility as be could in a mere babbling brook. He can remain down the entire day. if he chooses, open his shells at his leisure, and make choice upon the spot, of those only which are valuable. Three men by the use of this apparatus could do as much work as a hundred by any other appliances hitherto devised.
This principle of purifying vitiated air, it will furthermore be seen, is eminently applicable to the ventita. tion of mines. But our remarks have already extended to a greater length than we had inteuded, and we close, with the intention of maling further allusion to it in our next issue. The principle involved in this invention is one of ths most interesting discoveries of the age, ond, we think, our scienttific rerdera will duly appreciate the space we have allotted to it.

1ncident. - The San Andreas Register relates the following incident connected with the Keystone Copper Mine, which shows how dame fortune often rewards those who persistently seek her favors. Mr. and Mrs. McCarty each owned an interest in the claim, asd Mr. McCarty sold his interest some time since for $\$ 10,000$, and endeavured to persuade his wife to sell hers, which she refused to do. To-day she can take $\$ 100,000$ for the same interest.

## THE MINING SHARE MARKET.

The unusual excitement in the Mining share Market, no-1 ticed in our last issue, has materially subsided, and most of the leading stocks, which so suddenly advanced, bave de-1 clined. The Market for the past six days has been some what fluctuating, and the transactions quite limited compared with the extraordinary business of the week previous.
Gould \& Curry has declined to $\$ \overline{5}, 600$, with a limited demand.

Ophir shares have been in considerable demand at about previons rates. 144 shares have changed hands the past week at $\$ 2,500$.

Central has been enquired for at $\$ 2,850$; sellers to the extent of 12 shares have been found at that figure. The sudden enquiry for this stock has been in consequence of advices from the mine that ore of superior quality has been struck, with indications of continuance.

California, adjoining the Central, has been effected to some extent by the favorable reports from the latter mine, and has also been called for at $\$ 15,00$. Twelve shares have changed hands at that figure. The stock in both these companies is confined to a fem hands and held firmly.

The fact of a known location on the Comstock lead, with undisputed titles, renders the holders of stock in these two Companies, perfectly content to wait the gradual development of their mines; hence their stock is seldom effected.
Daney shares have fluctuated greatly, ranging from $\$ 240$ @ $\$ 330$, closing the week at about $\$ 300$. Seven handred and forty shares have found buyers during the week at the fignres named. The July dividends winich were sold for $\$ 13$ @ $\$ 14$ ten days since, dropped to $\$ 4$ @ $\$ 8$ on 'Tuesday last. at which rates the dividends on 750 feet were sold. (See Report of Transactions.)

## MININGANDSCIENTIFICPRESS

the corper internat.
We continun to hear encouraging reports of the copper itenst, from every direction whore any attention has been faid to searching after that mineral. stucks in all the leadHeg mines are constantly adsancing, and the attention of spitalists is being quite generally directed to this class of fines as extremely valuable property for pormanent iavestrents. Ot the many discoveries which been unnounced, it an hardly be expected that anything like a majority will rove productive; , yet suflicient developments have already een mado to satisly capitalists and the public that we may easunably look to tho copper interest as ove of ligh promse, and une which, at au carly day, must vccupy au imporant position among the industrial resuurces of the State.

## RAXSACTIUNS IN SHARES, FUR THE WEEK.

 45 North Potosi

GENERAL MINING STOCK REPORT.

## REPORT UF EIDS

At the San Franclsco Mining Stock Board,
For the week exdiog July 4, 1863.

## REMARKS.

There has been considerable activity in the Virginia Stock Market since our last quotations, and the general attitude of the Market has been firm, with advancing rates in cading stocks.
Some promising developments have been made in both the Virginia and Guld Hill listricts; among which are reported the York, Insurance. Pride of Wachoe, La Fayette, etc. These discoveries have generally been made ypon what are denominated the "back ranges."
Grass Valley is still in demand and is quuted at $\$ 70$ (a) \$75. A new claim, of small extent, called the Ruby, located near the Moscow ledge, has come into notice, and is quored at about $\$ 125$.
Many important changes have occurred since our last quotations, especially in Gold Hill Stocks. Yellow Jacket has been quite extensively dealt in at considerably advanced figures. Leon has also been in much request, but at reduced rates.

## ESMERALDA STOCK LIST.

[Corrected for the Mining and Scientafic Prese, Juip 2, 186\%.] *

The various ledges in the District continue to turn out large quantities of rich rock, and for the past ten days most of the mills have been steadily employed.

About 2000 ounces of Bullion was shipped during the past week.
The "Juniata" Tunnel on Martinez Hill is now in to a depth of 170 feet. Six ledges have been struck in the Tunvel, most of which prospect very rich. The rock from two of the priucipul ledges-one of which is 12 feet wide-assays $\$ 600$ per ton.

The "Cincinawa" on Silver Hill has been enjoined by the Utah Company, otherwise the stock would rate at a very light figure, the lode being considered one of the best in the District.

We understand that the Cincinawa has offered to suspend operations and pay half the expenses of shipping the Utalh to prove whether or not the claims connected: The Utah however decline-which would seem to indicate that there is really no foundation for a dispute between thest two Companies.
The Cincinawa is known as Cortez Consolidated G. \&

## WHEELER'S

Amalgamating and Separating Pans.
It is ackonwledged by all who have examined the privciples and wituessed the operation of these Pans, that
they are decidedly superior for trituraling and amalgaroating purposes to any other io u6e.
The most important principle connceted with the oporatiou of these Pads is the sepraration of the triturating
proweas from tha $t$ of exrracing the provess from thit of exmacting the amalgam from the
sand. The shief cause of luss of che precious metals arises from the passing off of the same in combination with the quicksilver, during the proces of trituration, and in
cleaning up By the introducion of the Separating Pnn cleaning up By the introduction of the Separating Pon
to f. llow the trituration this loss is cutirely avnidud. In to f. llow the trituration this loss is entirely avnidud. In
workiug these machines there is no nppreciable loss of Where theer Pans have been introduced and operate oy the side of others on sands from the same vat, the Wheeler Paus have uniformly gained a large percentage oImetals over ita competitors, ns woll as a still larger parcentage in the amount of work performed.
** These Pans man be scen iu daily operation, at the Siner's Foundry, on First atreet in this city, where at oterested are invited to call aud examiue for themselve

San Francisco, June 18, I. H 88.
Offle of tho Nevadin Copper Mining Co. Mrech 24. J\$63.-At a meeting of the Board of Truates
held lhis day, an assessment of Forty Gents per share was levied upon the Capital Stock of the Gompuny, paywenty (20) cents per share within sixty days from thi date, to the Secretary. By order of the Irustepr,
W. B. EWER, EDITOR.

Bvery person at all acquainted with the focess of amalganating Ores, kuows that it necessary to reduce the ore to the finest fssible condition in order to ob'ain all the utal contaiued in it, and the quicker the fo it reduced to such a condition, the nore pid will be the the process. To meet this cessity has been the object of the invenon we illustrate te-day.
Most of the A malgramators now in use, are hastructed with mullers of some sort deFrod to reduce the ore while the amalgaation is going on, but the time required vafo according to the speed at which the mulfean be run without producing too much tation of the pulp. Some mullers do not hmore than twelve to fifteen revolutions If minute, and from six to eight hours are ihuired to reduce 200 pounds of ore to the guisite fineness, whilst other mullers run ch fuster and consequently do the work lek quicker.
I'ae Little Giant Avalganator, promisto du the work in much less time than any (er Amalgamator in use, when run at the ghe speed, as it has a:double grinding suWe copy the following description fn the proprietor's circular :
Pro 1 is a perspective view of the Lirvere fint Amalgamapor, with a portion of the fot of the pan renulled so as to slow the pltion of the mullers when in their proper
pis for working. The mullers A B C are pia for working. The mullers A
cstructed in the following manner :
is the bottom die furrowed or guttered, ajepretresented by Fig. 3, and lies in the biom of the pan, and is stationary when 1 , runner is in motion. $B$ is the runner, a) is furrowed or guttered on the hottom 8i, as shown hy Fig. 3, oxcept that the gers cross each other so as to work shearif like an ordinary mill-stone, whell grindin This runner rests on the bottom die. he upper side of the runner is guttered 0 urrowed. as represeuted in Fig. 2. The th of the plate, A, is furrowed or guttered - he bottom side, the same as the top side o he rumer is gattered or furrowed; and Win placed on the runner, the gatters are relrsed or made shearing, thus making a Elding surface. The top plate is stationaryput so arranged that it can be made to ry upon the runner by means of the scrows, 4 E .
e top plate has slo's or openings commuiDi) ting with the gatters or furrows, so that 6.pulp is contiunally running through them Wh wrorking. The pan is capable of amalguating from 800 to 1000 lbs . at a time : 81 from the fact that the top plate is stalihary, the multer can be run at almost any - 8 d desired without giving two much agitatin to the pulp. The construction of the iif and ruuner is such that the pulp is driven rom the center to the side of tbe pan in thoottom gutters, and from the side to the ceer of the pan through the top gulters,

Coleman's Little Giant Amalgamator.

EIG. I.
thus creating a constant molion back and forth through the gutters, and causing all portions of the pulp to pass between the grinders, and is thoroughly ground to an impalpable powder in about latf the time of any other günder in ūse. A most important point in connection with these griuders, is, that they are adapted to any pan in use, and those having other pans can have the mullers put into them at a small expense by forwarding size of pan and hub; also, the depth
of the pan.
'This pan may be seen in operation near

the Miners' Foundry, in this city, where: all interested are invited to call and see for themselves.
Since the above illustrations were prepared the inventor of this Amalgamator has added a new and important improvement, which it is believed will add largely to iis efficiency as an amalgamator. This improvement consists in easting the mullers with wroughtion strips in them, placed lengthwise between and parallel to the slots and
furrows o! the dies and plates. When the amalgamat $r$ is working the wrought iron stripa cast into the muller run against the similar atrips cast in the stationary dies, thereby producing the same effect on the pulp as is produced in the "barrels" when working after the Frieberg Process.

Mr. Fditor:-Your anuouncement of Prof. Ryerson's valuable discovery in purifying the air in Diving Bells, suggests some further inquiry as to the liberation of the oxygen in the crrcumstances mentioned. Will some of your readers favor the public by discussing the proability of the newly observed action of spray, being due to what is known as the action of contact with finely dividedsubtances, such as the combinations of nitroger, effected by pla-tinum-black-of hydrogen and oxygen by the sume-of sulphurous acid and oxygen by oxides of chrome and copper? Is it not that the increased surfaces of the numerous drops of water absorb and condense gases such as carbonic acid, and modify the chemical affinity of their elements?
A. Poor Chemist.

A Poor
San Francisco, Ju'y 10, 1863.
Progressive.-The Vulcan Foundry have found their Office too straight and narrow for them and have removed it to the rear, on First Street, and are now erecting a new and commodions Office upon the site of the old buildiug.

South Pare Quartz Mili.-As will be seen loy Messr:- Smith \& Co's Advertisement, we have a veritahle Quartz Mill in San Francisco. An examination of the Mill enables as to pronounce it also a very complete one. A moments' reflection will show its advantages at the present time. Persons coming to this city with cre of any description, can have it crushed at Messrs. Smith \& Co's, under their own supervision, and learn to a fraction the value of their ruck.

Lubricatina Oil.-Many substitutes have been proposed for the more costly oil for Inbricating machinery but hitherto with only partial success. An English patent consists mainly in the addition of caoutchouc to common grease the former being softenéd by spirit of turpentine; butit also containsother ingredients. For example: 10 gallons of water being heated, 1 pound glue and 10 pounds carbonate of eoda are sfirred in, 10 gallons of oil or grease are next added whereby a quasi soap is formed, and lastly 4 pounds caoutchouch, softened by terpentiae, are incorporated. The French process is as follows : Add one pint finely minced eanutchoue to 60 pints rape oil, and heat until the mixture is com-pletea-A very unctious nil is thus formed, which remains fluid at freezing temperature, and does not clog the machines, but facilitates the motion of their parts.

## MINING CORRESPONDENCE.

Notes of a Trip to Slife Range via Los Angelos aid El Paso.-No. 5.

Mesquit Springs, June 8 th, 1863.
Messes. Ewer \& Smith :-Your favor of May 13, came to hand on the 5th, and I have to-day received some paper which euables me to go on with my currespondence, also, Nos. 26, 27 and 28 of the Mining and Scientific Press, for which I am much obliged. I believe that I can get some subscribers here for that work, as soon as a little currency begins to circulate. At present no one seems to be made of coin in any way. All who come here to prospect are well supplied with provisions, and tools, and those who have been out long enough to require supplies, notify their resident partners, in Los Angeles or San Francisco, aud the goods are forwarded, and the bills of purchase and freight are all paid at Los Angeles or 'Frisco.
scarcity of change-sackett's express.
We would spend some change for paper, postage stamps, envelopes, \&c., if there were any here for sale. There are none except the few each may have in his packet, and we have to order a supply from Los Angeles, our nearest postoffice and 147 miles South, requiring 30 to 60 days 10 get returas.

Your tavors came by Sackett's Slate Range Express, advertised to leave Los Angeles promptly on the arrival of the Senator from San Francisco, taking freight and passengers, fare $\$ 10$ and walk all the way, and ten cts a pound for freight blaukets, provisions, \&c. On the 10th of April he arrived in Los Angeles from Slate Ravge, and now on the $\overline{\text { th }}$ th of June, he is within two days of Slate Range, on his back trip. When horse Express teams get over the road in such style what can be expected from ox teams which are more popalar on this route than horses.

## Ladrel hill and the mines generaliy.

About the middle of last month there was a general stampede of miners from all the camps to Laurel Hill about 15 miles Nortil and the end of the El Pasorange in that direction, leaving me to take care of the goods and chattels of three camps here. All still remain there and I am confined at the Springs and cannot leave to prospect or examine the claims which are taken up in this vicinity. Neither can I get any information fiom any one in regard to the first discovery of this District and its general history. I expect some of them back in a few days, to develop some leads which show very rich croppings.
There will be a number of tons of rock from various leads ready for shipment next week, and teams are expected to call for it, on their return from Owens River, Coso, \&c., \&c. I shall certainly be able to procure you some specimens next week and send them forward.

When we have returns from these lots soon to go forward we shall know more what to say of the District; at present we are quite in the dark, though our hope is large, and nearly every man has had experience in Slate Range, and considers this to be quite superior in some respects to that locality, and again a lead which will assay here one half as high as one in Slate Range would be equally as available, as there is water in plenty here, and wood can be delivered at less than half what it can there, and freight from Los Angeles can be landed here at half what it can at Slate Range. miLLS AND MTLL PRIVILEGES, ETC.
We are about 45 miles southwest from Tehachapa Valley, where Messrs. Bright and Lyons have a saw mill in successful operation on a living stream of waker, and they are preparing to erect a quartz mill of five stamps to run half the time. Again at Ōak Creek 45 miles sontheast, there is plenty of water power for a dozen mills, and we shall. soon have a chance to crush and reduce our rock, if we find it as good as it looks.
Gentlemen, as soon as you find our croppings to be worth working, say at an expense of 75 dollars per ton, you might offer that machinery you advertise on your last page, to some parties having good claims here, and thus receive a permanent interest. [We are anxiously watching for those "croppings."-Publishers Press.]
Some of our best leads are now offered as follows : The owners will deed one claim of 1200 to 1800 feet to any party who will sink a shaft on the same sufficient to confirm its value, say 30 to 50 feet, or tunnel to same depth, and

Messrs. Banning, Keller, and Moore of Los Angeles are now opening 10 to 20 leads on those terms, aud will soon ship the rock to Frisco to determine its valne.
It seens to me that large quantities of rock can be got out here now, from croppings, which will pay a profit to ship, though the charges are about $\$ 100$ per ton.
C. W. T.

## Silver Mountain, Hiast Fork of Carson, $\}$ Amador Co., June 24, 1863.

Friend Scientific Press:-Believing that many of your readers will be interested (I know that some of them will) in matters pertaining to this region, 1 give jou the following facts and speculations with regard to what must unquestionably prove, ere long, one of the best of all the new locations of the Eastern Slope.
Silver Mountain District is situated on Silver Creek, a tributary of the East Fork of the Carson River, some 21/2 to three miles above the junction. Silver Creek has at the present time a volume of something like a thousand "streams," (12 inches to a stream) and 1 am told that it will be little if any less during the season : probably it is never smaller than one half that, amount, and has such fall that I think a mill privilege can be located to av erage one in every 500 yards of its length. It flows a little on one side of the beautiful valley in which is sitasted the present town of The "Mountain," or as its earlier settlers call it, "Koningsburg."
The town contains some 300 inhabitants, is well supplied with stores; illy supplied with whisky shops (though there are many of them); has a lst class frontier hotel, a good restaurant, besides several boarding places where a hungry man can get his regular hash, a bakery, livery stable, blackswiths, shoemakers, one sawmill, another going up, and
some of the most promising mines ever found.
The Mountain No. 1, just incorporated, is undoubtedly the Comstock Lode of this District, if indeed it is not, as some assert, a continuation of that great Mother vein itself. An old mountaineer and prospector tells us that he has traced it through the whole sixty miles that intersect between this point and Virginia City. Certainly, from specimens of rock in my possession, it can be seen that an intimate relasionship exists between this and the original Gould \& Curry, and a number of conneisseurs have also remarked this to me.

Mountain No. 1, is a claim of 2750 feet in length, well defiued throughout its whole surface length, with at times, splendid outcroppings. It was discovered by a party of Scandinavians, by whom a tunnel was run in some 260 feet, which tunnel has struck the lode, here about 12 feet wide. Any quantity of rock can be obtained with small expense, which it is supposed will pay well for erushing.

The expense of transporting to a mill will be absolutely nothing as the ore can be thrown into a "shute" extending from the dump pile down some hundreds of feet to a magnificent mill privilege. Several well known capitalists are trying for this claimand a controlling interest must undoubtedly ere long change hands, as it can be obtained at very reasonable figures, its principal owners knowing well its great value, but willing to sacrifice something to expedite the the erection of a fine mill.
Northward of the "Mountain" Co. are the Mammoth, Silver Prize, and St. Charles, on all of which work has been or is being done. Southward, the 1st Extension is the Jefferson Co., who have ran a 30 feet tunnel and have up a nntice of another contract to let. Above the Moantain some hundreds of feet is the "Big Tree Company." They have a splendid out crop, and have let a cortract for 50 feet of tunnel which will probably strike their ledge, which they will getinto about the middle of Angust at farthest, judging from the energy of the Contractors.

And here let me digress for a moment from leads to speak of the needs of the District and the chances for laboring mev. There is an abundance of work for 1000 men in Silver Mountain alone. Daring 24 hours of my sojoura here, over eleven thousand dollars (so I am informed) has been pledged to build the road in from Hermit Valley to this great point. This will require the labor- of some seventyfive or one handred men forsixty days time. Nearly or quite that number are now employed on that part of the route between Hermit Valley and Big Meadows, (31 miles this
side Marphys) and when the road is complete from Murphy's to Silver Mountain, (ouly 56 miles) there will be money eubscribed very soun to carry it to the East Carson, down thro' the Monitor, Alpine and Mogul District to Washoe, by all odds the nearest, best and pleasantest route, pas-ing through as it does some of the most picturesque and grandly sublime monntain scenery on the globe. I'here are in this District probably 80 tunnels being run or shafts sunk, Laboring men get by the day $\$ 4$, but the most of the work is being done under contract, at from $\$ 121 / 2$ to $\$ 30$ per foot, at: which good drifters commonly make much more than day wages, even to as high us $\$ 20$ per day to the man. More tuanels would be commenced, more wori would be done, if there were more workers to do it, and what better feld preseuts itself to laboring men, considering in connection with the chance for gain, the absolute healthfulness of the location and the certainty of his getting his pay?
Next to the great need of labor is the need of roads, but this in some measure depends on the former, and the parties now in charge of the undertaking, will unquestionably find means to get their highway open early in September, so that, instead of as now, long lines of laboring pack-mules, the long line of mule teams will with their jingle of bells. make "Babel" in the streets of Koningsburg. More anon

## SPECIAL NOTICE.

Some weeks since we forwarded blank receipts to such o our subscribers as are in arrears for their subscriptions. Some have promptly answered by remittances of the amounts due others have notified us of special contracts with our prede cessor, or of full payments made to him and not credited ol our books. Where payments have thus been made, we have in every instance, allowed them. There are quite a num ber, however, who have returned no reply to the bills whicl have been sent out. We trast all such will respond imme diately upon seeing this notice. If payments have beel. made, we wish to be notified of the fact; so that due credl. can be given ; and if there are any to whom the paper is nov sent who do not wish to continue it or do not intend to pa : their subscription, we hope they will notify us of the fact si that we may discontinue sending papers to them. We d not wish to crowd the paper upon any man. All the name upon our list have been placed there, as subscribers, upol what we have deemed good authority. If any party, no considering himself a subscriber and in arrears, has receiv ed à bill for subscription, he will confer a favor by notifyia' us immediately of the fact. Postmasters are also reminde of their duty to return a paper that is not called for, etc.
Noxtce.-In our advertising columns, will be found th card-of Brodie \& Co., California Foundry, Fremont 'si near Market. In their particular line of business, makin plain and ormamental castings, for stores, private-house and public works, they exhibit workmanship creditable themselves and the city.
We would call attention to the Card of D. Morri in our Advertising columns to-day. Those wanting Fir proof Safes made or repaired, will not find a better workms in town, than Mr. Morris, 227 Market Street, corner Beale.

Excelsior Tron Works.-The Card of Gallagher Kenney, Manufacturers of Architectural and Ornament Iron Works, will be found among our new Advertisement to-day. These gentlemen are prepared to execute eve kind of work in taeir line, with dispatch, and in a style to be excelled by any other Manufacturers.

We would call attention to the Card of H. C. Kibbe, Es Mining Secretary and Commissioner for Nevada Territo which will be found in our advertising columns to-day. A business entrasted to his care will be promptly attended

Kamptulican.-Lieut. G. Walton, of the British Na has proposed a mixture of sawdust and caoutchouc un the name of kamptalican, as a linigg for iron war vesse The inventor claims that from its elarticity, it will imme ately colapse when penetrated by a ball, and thus previ the entrance of water. It also deadens concussion, and its buoyancy will keep a vessel afloat though it shonld riddled with shot, and moreover will prevent loss of life ca ed by splinters. [The Cormplanter and Mechanic.

## MINING AND SCIENTIFIC PR心SS

LIST OE MINING COMPANIES HAVING OEFICES IN SAN FRANCISCO,

## COPPER-ITS PRODUGTION AND DEMAND.

Copper is one of the six metals spoken of in the Old Testanent, and one of the must important of the seven which were knowu to the aucients. The earliest artificer known in history, Tubal Cain, accurdiug to the writer of Genesis, was a worker in "brass," which is an alluy of copper. This testimony of the sacred Writ is somewhat cunflectiug with the text of the ancient Greek Histurians, who attribute the discovery of copper to C'adurus, who lived cotemporary with Joshua. Whether the discorery of cupper should date from the days of Tubal Cais or Caduus, there is certainly abundant testimony that it is at least one of the earliest known metals. Aside from its mention in the most ancient records, it is readily supposable from the nature and mode of its occurtence, hat it must early have come into usse for weapons of defence and utensils of indastry. Occurring as it frequently does, massive and native, and often detatched, by water, frum its origibal matrix, it is most reasouable to suppose that it must have thus been found at an early day, in localities where warlike people resorted to seek stones with which to shape their instruments of war: or out of whieh to form those instruments. The peculiar lustre, weight, and maleahility of this metal would naturally altract attention, and thus, it is more than probable, that copper wae the first metal upon which wers essayed the earliest at tempta at primeval smithery. Perhaps we might, with a kigh degree of probability, divide the honors with the ante and the post-diluvian celebrities, by according to Tubal, or his ancestors, the discovery of the native metal, while his post-diluvian rival in the honors of discovery might have taught mankind how to obtain metal from its ores.

Copper, either of itself or in its alloy: with tin and zine, for a long period of time, doubtless, constituted the chief metal employed in the arts, agriculture and war. It must have entered largely into commerce at an early day. Th Colossus of Rhodes, which was constructed of an alloy of this metal, affords a most convincing proof of its great abundance at that time. It is stated that the canal which was dug across the Is hmus of Suez, by the Ancient Egyptians, the remains of wh ch have been unearthed, in places, by the present effort, in that direction, by Louis Napoleon, was constructed chiefly for the purpose of connecting the copper producing countries of Arabia with the region of the Nile-another evidence ef the great abundunce of this metal at an early day.
The remains of ancient copper mines are to be seen, at this day, among the Ural Muautains, which were worked by copper tools, as is koown from their remains, and of course at a period anterior to the introduction of iron for the manufacture of tools.

It is only, however, siace 1830 that copper has been pro duced in anything like its present abundauce. In that year the total amount of copper produced throughout the world was but 25,500 tons ; in 1840 the amount produced was 41,000 -nearly doubling in ten years-in 1850 , the production had reached 54,700 tons. The product of 1860 is es timated, by competent judges, at 70,000 tons. Yet, rapid as has been the increase within the last thirty years, the price of that metal has risen very notably.

When the world was startled by the first reports of the wonderful gold discoveries in California, the opinion seened to be pretty generally entertained that, under such prodigious supplies of the precious metal, its value must depreciate. The same question again agitated the commercial world when the extent and magnitude of the remarkable silver discoveries of Washoe became fully known. Notwithstanding the fact that guld and silver still maintain their value and promise to do so to an iudefinite future, we yet find a similar class of predictions in ragard to the supposed cansequences to result from the immense proapective increase of copper from the newly discuvered mines of this State.
In examining this question briefly it may not be amiss to lcok a little into the past. As will be noticed from what we have already said, the history of copper mining has commenced a new and important era withia the last twenty-five years. During that time its production has fuily doubled, and yet we find the refined metal (though subject to considerable fluctuations) constantly increasing in price. By reference to English statistics we gather the following fact: in reference to the amount of copper ore sold in Eugland
and the price of the refiued metal, in the British Market
$1800 \quad 55,681$ tons of ore suld $\$ 586$ price per ton $\begin{array}{lll}1800 & 55,681 & \text { tolls of ore sold } \$ 886 \\ 1810 & 66,14+8 \\ 1420\end{array}$ 1820
1830 1830
1835 1840 $184 \overline{0}$
1850 1820
1952 1952
1854 1856
1858
1858
1859
From the above it will be perceived that notwithstanding the constautly increased production of copper in Great Britain the price of that metal has advanced fully fifteen per cent. since the commencement of the present century.

Again, let us refer to statisticts of our own country. The yield of the copper mines of the nited States and Canada for the year 1840, was but 100 tons; we have no dala for fixing the value of the metal oth $r$ than by the ruling price in Great Britaiu, which was $\$ 5042$ per ton. In 1850 the yield of our mines had increased to 650 tons, and the price of copper in New York was $\$ 420$. We subjoin a talular sta, ement, derived from the best authorities, of the value of copper in the Now York Market from 1850 t the present time, together with the production of that metal in the United s'ates for the years 1852 , '63 '57, '61, and an estimute for the pres ent year :

| Year. | Market Value per Ton. | Tona Protuced. |
| :---: | :---: | :---: |
| 1850 | \$420 | 650 |
| 1851 | 425 | . |
| 1852 | 425 |  |
| 1853 | 583 | 2,000 |
| 185.4 | 546 | ... |
| 1855 | 567 |  |
| $1 \stackrel{5}{6}$ | 535 |  |
| 1857 | 260 | 3,000 |
| 1858 | 463 | ... |
| 1859 | 460 | $\cdots$ |
| 1860 | 441 |  |
| 1861 | 425 | 7,500 |
| 1862 | 567 |  |
| 1863 | 690 | 12,000 |

It will be observed, from the above, that the advance in the price of copper in the United States has fully kept pace with the adrance in the English Market.
The annual consumtion of copper in England, at this time, is about 30,000 tons, about one third of which is obtained from her own mines. Germany consumes about 20,000 and France about $1 \overline{0}, 000$ tons of copper aniually. The consumption of the United States for the present year is estimated at 15,000 tons, and that too, in face of a most unprecedented advance in price, while our production of that metal is estimated at only 12,000 .
The recent discoveries in this State will doubtless exert considerable influence upon the copper market, when the mines come to be thoroughly opened. But the effect produced will not be of greater value than the fluctecations noted above, in both our own and the Euglish Market. The constantly increasing demauds of commerce, and the innumerable purposes in wtich copper may be employed as an alloy, provided but a small reduction only, in price is effected, w.ll so increase the demand for this metal that our copper miners need feel no uneasiness lea=t their stalwart arms or rich ore producing mines shall so glut the market of this metal, as to bring its price down to an unprofitable staudard. Let our copper mines prove as rich and productive as the most sanguine may hope for, a mine producing shipping ore of a fair quality and in good quantity cannot fail to become a most valuable property, and as safu an investment as can be found in any branch of business.

195 $\mathrm{W}_{\mathrm{E}}$ are receiving letters almost every day from parties who say that they have "struck it rich," and by the aid of knowiedge derived from articles in the Mining and Screntific Press, have been enabled to distinguish what was valuable. One correspondent writes that he was led to examine certain rock, by reading an article in the Press deseribing ore, and found it to be very rich ore, Had not his attention thus been especially directed to it, he would in all probability, bave passed it over in atter ignorance of its valne. Anothor says, "I was first led to notiee copper rock by articles is your paper, calletl the 'Miuers' Laburatory,'
and found it to be a rich lead, but, what is strange. I had previously walked over the spot a thousand times without suspecting it to be of any value."
It is a source of uosmall congratulation with us to learn from the miners themselves that we are making the paper valuable to them as a claes. All the return we ask is
that our mining readers will do what thy can to aid as in that our mining readers will do what thy can to aid us in
giving the Priss the largest amount of circulation possible throughout the mines, as well as in the great commercial cities of the State.

## A VERITABLE GOLD MINE IN SAN FRANCISCO.'

For several years past it has, from time 10 time, been announced that gold bearing, and other metalliferous rock bas been d scovered in and near this city. That such ruok has been fonnd, as isolated specimens, or in very small quantities, is beyond a doubt. But we opine that it is only with. in a few days, or weeks at most, that grold bearing rock has been discovered in any considerable quantity. 1t appears now, however, a pretty well authenticated fact, that an immense mas: of auriferous quarta, of a bighly metamorphic character, has been protruded upward throngh the bed of slate upon which this section of country rests. How ext of sive this protrusion may be we cannot say; but atall events the high ridge, just back of the Mission Dolores, with the two rocky prominences nearest that location are capped, if not ribbed, with an immense mass of porpliyritic quartz, in a highly metamorphosed condition, and presenting to the eye of the practiced miner, strong auriferous indicatirns. We are assured furthermore, by parties in whom we have every reason to place confidence, that gold can be obtained, by ordinary pounding of the debris of the rock, to all appearance in workable quantities, over an extent of country from one to two miles in length, by from fifty to five hurdred feet in hreudth. Mil ions of tons of this rock crop out upou the surface, in some places presenting almost perp itdicular masses, and scores of feet in extent and height. Some eight or ten Companies have already been organized, and active preparations are in progress for thoroughly teating the value of this discovery. One Company has had several lots of rock crusht $d$ in the city and subjected to the panning and amalgamating process at the Miners' Foundry, with results varying frm $\$ 20$ @ $\$ 10$ per ton. We have seen one lot of amalgum, weighing six ouncos, taken from 1000 tbs. of ore which was still undergoing a furiher process of treatment. This rock was taken from the surface, with even the moss clinging to it, and thoneands of tons more of precisely similar rock is in plain view-in fact a perfect mountain of it! The owners of this claim purchasep their title from Spanish Grant, before the knowledge of the existence of the go decame known, paying therefor $\$ 30,000$. A large number of claims have been staked off.

Old Dr. Beecher's Idfa of Meaven.-"Excepting exception from sin, intense, vigorous, untiring action is the greatest pleasure of mind. I could hardly wish to enter Heaven did I believe its inhabitants were idly to sit by purling streams, fanned by balmy airs. Heaven, to be a place of happiness, must be a place of activity: Has the far-reaching mind of Newton censed its profound investigation? Has David hung up his harp as useless as the dusty arms in Westminster Abby? Has Paul, glowing with Godlike enthusiasm, ceased itinerating the universe of God? Are Peter and Ayperian and Edwards and Payson and Evarts idling away eternity in mere psalm-singiug? Heaveni is a place of restless activity, the abode of never-tiring thought. David and Isaiah will sweep nobler and loftier strains in etervity, and the minds of saints, unclogged by cumbersome clay, will forever feast on the banquet of rich and glorious thonght. My young friends, go on then ; you will never get through. An eternity of untiring action is before you, and the universe of thought is your field."

New Weapon.-The manufacturers of Sharp's breachloading pistol have produced a new weapon, which though weighing but 24 ounces, is capable of bringing down a squirrel or a bird at a thousand yards distance.

The "no Cards" Mania."-The no cards mania is extending. The Canada papers attach "no cards issued" to their funeral as well as their marriage nutices.

## THE MINING SHARE MARKET．

The Mining Stock Market fur the past week has been pactive，especially in realing shares．Tho transactions ive been mustly of a speculative character and in middle luse stucks．
The Gould \＆Curry has declined a sliade further and may kow be quoted at so，ju0．
Opher is held firmly at previons lates．A dividend of $\$ 48$ or foot was declared on the 9 th instant．
Savage maintains last quotations．It clused at $\$ 3.500$ ． Chollar is firm at a slight advance．A large quantity of fock frum this mine is now being crushed，the result of hich is anxiou－ly looked for．
Sacramento has advanced about $\$ 20$ ，upon rumors of a ompromise with the Meredith．
Considerable speculation bas been noticed in tne Pride f the West and Buckeye，both of Devil＇s Gate District， ach of which is beginning to attract attention by reason of foomble developments at the mines．The shares of 1ese Companies have advanced about $\$ 50$ to the foot，dur－ go the piast week．
Wide West has been quite largely dealt in at improved， hough fluctuating rates．It has been the favorite of the reek， 342 feet having changed hands ut $\$ 160$＠$\$ 200$ ．
An increased attention is being given to Humboldt shares． heha has been quite largely dealt in ； 136 teet having hinned hands the past week at rates varying from \＄400＠ 450 ．A quantity of ore from this mine，is now on its way $b$ Frieberg，where it will be worked after the most approv 1 Geramo process，as a reliable test of the value of the no mine．
The chief exciting mining topic of the week has been the portive attempt to dispussess the present occupants of the Imaden Quicksilver Mine，by virtue of an obsulete Con ressional Act of 1807．Fortunately for the State and fountry the attempt was foiled by a brief telegraphic cor－ sspondence with the President，who has stayed all imme－ fate action in the watter．
Another matter of nearly equal interest，is the announce－ ent of the transfer of the Mariposa Estate to a mam－ oth New York Company，who have organized with an suo of Shares representing Ten Millions of Dollars．＇The ew Contpany assumes all existing liabilities of the Es－

## THE COPPER INTEREST．

Copper still continues to absorb much interest，and the porto from the mines are quite as encouraging as hereto－ re．We have elsew here thrown out a few hints which it ay be well for all parties to bear in mind．An undue ex－ tement will result in no general advantage，but may lead muchindividnal disaster．
A correspondent writes ：＂At Sult Springs，to the north－ ard of Cepperopolis，the D＇Jue Company are taking out rge quantities of blacks sulphurets of copper from a vern jren feet in width．One interest of 200 feet in this mine $\beta$ been sold for $\$ 4,000$ ，within ten days．The New Era jompany who hold the extension on each side of the I＇＇Jue， e sinking on their South claim，and at a depth of about xty feet have struck the same indications．Negociations ye now pending for the purchase of their North claim by e agent of some Parisian capitalists who have recently ar ved here．The D＇Jue and New York Co＇s expect soon to ＂ve ore on hand for shipment．＂
In Plumas and Placer Counties，a like excitement exists hd shafts are being sunk and tunnels run with some pros－ pet of success．
There are now numerons buyers of copper ore in the mar－ et，deliverable in this eity，for shipment East．The Cali－ rnia Smelting Co．arealso buying for their works at ntioch．
The Union，so far，is the only dividend paying copper ine．
The Oriental has sufficient ore on the surface to pay all cpenses to date，and leave a surplus．They will soon com－ ence shipping．Several Companies will soon commence aying dividends．

## THEATRICAL．

McGuire＇s Opera House，the present week，has been nc－ cupied，up to Thursday might，with＂Lady Audley＇s Secret，＂ a dramatised version of Miss Brandon＇s novel，by Miss
Western．No piece，in our Western．No piece，in our opinion，has been presented
to the public，more deserving of the patronage it has receiv－ ed．It is，throughout，artistic，harmonious and trethful． The performance has been highly miritorious．
On Friday a new piece，called the＂Declaration of Inde－ pendence of 1776 ．＂by Mr．Howe．a well known resident of this city，was fresented．From an omission of the usual c mplimentaries，we are not at present able to report upou its merits．
The Eurfasa．－The Minstrels，this week have given their usual amount of fun，and received in return a corresponding amount of patronage．Two new pieces of interest have been presented．The one a song by a member of the Fire Brig－
ade，in answer to the popular，ballad＂When this cruel War ade，in answer to the popular，baliad＂When this cruel War
is over．＂It is considered a success．The other is a musi－ cal burlesque of＂Ihe Happy Man，＂with the scene laid in Japan．

Platt＇s Hall．－The attraction here is Wilder＇s grand representation of the W．ar，It has been well and fashiona－ bly attended，and is well worth seeing．Many of the scenes have a local interest，such as the death of Col．Baker，etc． We hope unother and final one will soon be added－the last battle field of the war and the surrender of Gen．Lee．

Origin of Mind－Man and Animals．－Phrenlogists re－ gard the mind as simple，and that its substance or essence is unknown．＂Mind，with all its fuculties and functions， has existed since the creation，and will exist till the human race shall become extinct；and no opinion of man，concerning the cause of its phenomena，can have the least influence over that cause itself．＂＂When we inçuire into the qualities，we find the thinking power in man to differ，not only in degree， bnt in kind，from that of the lower animals．He posseses moral sentiments，religious emotions，faculties of investigation and combination，of analysis，induction，which are denied to them．We are entiuled，then，by a legitimate exercise of reflection，to conclude that he is designed for another and a higher destiny than that which is allowed to them．＂

## THE <br> BRYAN BATTEIRY. <br> The vasp interest involved in the reduction of ores on this coast, renders it of the highest impritance that the <br>  <br>   ready been spent upou the various experiments in this class of sabininery, and it is an fuet well known tis all Who bave had ang practical experieuce in ihe matter, that every new process developed during he past tivelve years, has been set down as a failure. The ordiuary Stamp Battery

## METHOD OF CRUSHING ORE.

The Brans. Batriry, as now constructed, is helicved
ocombino all the improvemeds which tho experierco to combine all the improvements which tit
of the past has alforded. They have been

## EXCLUSTVELY ADOPTED

by mavy of the mast prominent Mining Compannics in the
country, and have beent, for the tliree puite ymars, sulbcountry, and have becc, ror the ellree puist yaras, sult-
jected to the severest of all test- that of coustant use-

Effective, Substantial and Reliable.
Thoy are now extensively used throughout. the mideral regions of California, Nevada and Mlexieo, and have establisherd a clnim to public confidence, nover yet
equalled ia any piece of machinery.
These Mills are constructed alinost entirely uf Iron,
and, consequently, aro not affected by the intonse heat and, consequently, nre not affectsal by the intonse heat and drynsss of atmosphere,
tied. They aro adapted to
BOTH WET AND DRY CRUSHING,
and are warranted to reduce, with the same weight of
Stamps, 25 per cent, more rock than stams, Elich Battery is couplete in itself, and forms a
use,
perfect mill-while any number of them can be added at a subseqent time-thus preserving the symetry and uniformity of the 4ili

As nn evinence of the increasing faver with which
these milis are regarsen, we wanld mention then these milsare regarsed, we wanld mention that the
Celebrated Ophir Company first introduced them into their works in 1880, und havo been addiug a number of Batteries, each subsequent year, until they now have
Nineteen, runuing Seventy-six Stamps,

They are perfoctly fitted and set up at our Works, be-
foro shipping, each pieco boing marked and numberod fore shipping, each piece boing marked and numberod,
so that they can be put up and spt at work in ten hours after arriving ou the ground. They aro made of two sizes with four aud five Stamps, etc. The Four Stamp and the Five Stamp about 7,oon. The Mortar Bed, when desired, is cast in sicetions, so that tho mills can bo pack

We annex the names of n few well known Companies Who have adopted them-running from frur to seventy
five stanaps cach-to wbom refereuce is mado:

## ESMERALDA

A most infortunate concurrence of circumstances seems to have operated, within a lew months pust, to greatly deprecia'e Vismeralda $s$ tucks, ami to destroy, to a great exient the confidence of capitalists in this city in the value of the mines of that region. 'Jhis depreciation, we hire good cause for believing. has not heen so nueh frum a failure of the yield of the mines, as from the had management of several of the leading (lompanes. . There are not a few who openly impute improper motives, to some of the man agers here spoken of. It would be difieult to convinco harge portion of the Stocklolders of the Wide West mine, that that mine might not under a proper management, have been made a dividend paying institution months ago, with its stock rating full one hundred per cent. or more, above Fits present market valne. Of the facts in the case we know but little; we sinply give the most current and commonly received impressions in Esmeralda, in justification of the ctaim set up for a fair average valua ion of the nines of that regiou. In addition to the above supposed cause for re-ac tion, much damage has unquestionably been done to good in terests in that r.gion by wild cal speculators, who have malmed off upon unsuspecting buyers in this city, thousands ff feet of ground, utterly worthless, and which in many cases never had any other foundation than the paper upon which they were represented.
Another important reason for distrust in the mines of Eismeralda has undoubtedly resulted in the following just 'cause for complaint" which we clip from a late number of the lismeralda Stan:
Thousands of ounces of bullion of gold and silver are Continually leaving our town. for which wo get no credit whatever. It is all credited to Washoe, simply because in prossing the Sierma Novada it is sent by the Placerville onte. We hope the Sonora road will soon be opened, and then Esmeralda and Bodie Districts will get the ciredit due hem. It is from this fact, more than anything else, that hur people have been averse to being thrown into the 'J'eritory.
The evidences appear to be conclusive that the Esmeralda region contains many rich and valuable mines, and it is a good cause of complaint that the bullion shipments from thence should be placed to the credit of other localities. The numprous will defined ledges, in that lucality, the large ;amount of work done on them, and the amount of bullion known to have been taken out of them give unmistakable avidence of their value. It is idle to talk about failure in a region where such claims as the Wide Weat, Antelope, Del Monte, Utah, Garibaldi, Ramboo, Ural, Crockett, Silver Hill and numerous other good and perhaps better claims are to be found.

Good will undoubtedly result from the present re-action fin Esmeralda Stocks. The time has goue by when a few Hoose boulders can be made the basis of a mining operation, ind wild-cat speculations can no longer carry iuto market heir spurious stocks upon the prestige of such well known alaims as those above enumerated. Already we notice a disposition in that region to fall back upon exclusively legitinate operations-to so develop the mines as to get good priees for their feet, instead of running to this city to dispose o
good feet for any price, by virtue of lard blowing. We lave much faith in the concluding paragraph of a private letter before us, from a friend in Fismera!da, who writes:"Give us good mills and honest men to work them, and we will show y
the shade.

## THE CULORADO GOLD REGION.

Considerable activity is now being manifested in working and developing the Gold Mines of Culorado Territory. The Miners' Register, of a late date, published at Central City. in that Territory, gives the following interesting items :-
"Yimid of thrae Quartz Mads-Messru. Lee, Judd \& Lee cleaned up from their Black Hawk, Eagle and T'ger mills, during the week ending May 2nd, \$4,582. During the week ending May 9 th, $\$ 5,434$, making a tatal of $\$ 10,216$. We doubt whether any of our eastern capitalists can boas of a greater income than this. It is at the rate of $\$ 265.626$ per aunum. We know of no reason why they should not do as well in the future as they have hitherto. Such are the results obtained from small beginaings in this land of gold Solid Gold.-J. Q A. Rollins showed us yesterday 2 specimen of solid gold, taken from Gold Dirt Lode in '60 which weighed over (90) dollars. This is the largest natural piece twe have ever heard of as having been taken from a lode in this 'lerritory. This lude furuished several of a smaller size soon atter its first discovery.
Beautiful Specmens.-We saw a few days ago, at Horon, Pratt \& Co.'s, a very fine gold specimen, from the Perrin Lode, tuken out at the depth of about twenty feet. It was a piece of thoroughly burned quartz celored with oxyde of iron. Wire gold could be seen all through it. We have long known the lodes of Russell's Gulch to be rich, and this is another proof of it. We were also shown another spec men from the Patch by Hon. H. F. Parker, containing several dollars in solid mass. It was contained in seam of quartz passing through a block of granite. But few finer specimens have ever been found in the country.
Gaylord's Purciase on tre Gregory Lode.-There haye been some important changes in the ownership of property lately. Among them we may name the purchase of the Parker Mill property by W. E. Gaylord, of. Washington, D C. This mill is conveniently situated in Nevada Gulch, ane has an abuidant supply of water. Its number of stamps is to be increased to twenty.four. The mill is to be refithed and put into complete runuing urder. Mr. Gasloyd also purchased a number of valuable mining clanos; among which we may specify some eight bundred feet on the Ne vada Lode, which rus within sixty feet of the mill and cap consequently be worked-so far as elevaíing quartz and wa ter goes-hy the mill engine. This lode promises very well It was first discovered by mining the gulch which runs along its course for several hundyed feet, and was in this way uncovered for a long distance. The sulphurets erop out so far as it has been traced. Mr. Gaylord has also pur cluased a valuable tunnel claim, which enters the mountain at the mill. The tunnel erodses all of the most valuable lodes on Quartz Hill, and if properly pushed will be a fine

## MINERAL WEALTH OF SOUTHERN CALIFORNIA.

Until very recently but little attention has been paid to the dev. lopment of the mineral resources of Southern Californin. Grerations have hitherto been confued to mere surface explorations. Scarcely a shat has been sunk beyond twenty-fiv. or forty feet deep, or a tunnel run any greater distance into a hill or ledge. Even these superficial explorations luve beell I nited, and confned to but a very small number of even thase veins whose existence has been observed. Still, the specinens obta nitd compare favorably with those from any other locality, either in the State or adjoining territories. An accumulation of such specimens would form a collection, which, for variety and richness, would compare favorally "ith almost any cabinet in the world. Guld and silver bearing quar' $z$, copper ore in all ita varieties, cinnabar. tin and other ores liare been found in this regrion, in great profusion, aud the country only needs a few more thorough and go-ahead miners, with a reasonable amount of capital to develop as rich a mineral country as can be found on the globe. We would inclurle in that region of which we are speaking the Owen's River and Coso country, Slate Range, 'tehachape, Soledad, Holcomb, Valley, Mohave, the region about San Bernardin , and the mountain range back of, and to the South.warl of Los Angeles, in which are located the Temescal tin mines,
Well authenticated reports from this region, "rom highly intelligent and practical -ources, unite in plaring the high' est pstimate upon its mineral value. The scope "pf country included within the limits above described is not less than 500 miles in circuit, aud a richer feld for exploration can scarcely be found.
The letters which we are publishing fron 'Mesquit Spring,' one of which will be found in the present issue, are descriptive of the North-western See'ron of this region. The min' eral developments of that locality are of the first order, as will soon be proven by ores which are now on their way to this cily. in lagge quantities, for treatment here. Our 'correspondent there, will doubtless keep our readers posted in regard to , be developments in his neighb rhood. We have for some time been intending to prepure a series of papers duscrintive of the Owen's River and Coso Cumtry, comprising the North-eastern sections of this region, for which wep have already an abumdance of data. (Our correspondent theve will please excuse us for the delay. We have not forgotten the mutual promise.)
I he attention of capitalists is alroady being directed to this portion of our Staide, und we understand but littre difficulty is found in making arrungements between capitalists and miners, whereby an abondanee of means is being secared, by the latter, for partial interesta in their mines, to propenly. open and develop them, with the nltimate erection of machinery: Miners in that region should lose no time in reducing their raims to shures. It is by such means only, as a gereral thing, that moneyed men can be indured to take hold of them, and their real value be propenly developed.
Is many parts of Penssylvania the people are growing an exceljeat substitute for tea.

## MINING CORRESPONDENCE.

Notes of a Trif to Siate Ravge vic Los Angejos and El Paso.-No. 6.
supplies for a prospecting party of thrbe.
Two No. 1, 3-10 pule picks, 1 drifting pick, 1 short and 1 long handl. d, r. und-poin ted shovel, 4 to 6 steel gads, 18 - 1 b cast steel sledge, 1 good hatchet, 1 goud born-spoon, 1 or 2 leather specimen-bags, 3 -quart, blanket coveled, iron canteens, wide straps over the shoulder; revolvers aud a double barrel shot gun, with plenty of powder, caps and course powper for rabbits, 1 -quart iron camp kettle, 1 4-quart do., lined with tin or a stew pan lined with porcelain or tin, to stew fruit in, 11-gallon iron coffee pot, riveted in every portion, with corer and strong buil, no nose except a little bend in the rim, 1 bake kettle, 1 frying pan, 1 large, tin, bread pan, 4 tin plates, 4 tin cups, spoons, knives and forks, 1 large iron spoon, 1 iron ladle, 4 tiu, soup, quart tins with handles; some wire to make pot-hooks; good grub for three months -100 Ibs . bacon and bam, No. $1 ; 200 \mathrm{tbs}$. flour, 100 tos. beans, 25 tbs. rice, 25 tbs. dried apples, 25 tbs. peaches, 100 N .0 . sugar, 2 doz., P. \& M's yeast porvders, 25 Ibs . green coffee, 5 Hts. tea, a box coffee mill, or the coffee can be tied in a bag and be beaten quite fine, between stones, 1 Hb . of pepper, 20 Hbs , salt.
I would also recommend that the prospector take along small quanties of lard, ginger, allspice, cinnamon, nutmegs, pickles, catsup, and also a gallon of vinegar, also a keg of sprup. But these are all luxuries which can be easily dispensed with.

In the line of clothing, one pair heavy blankets and one pair of light for each person; a few articles of stout miscellaneous clothing, 2 prs. of heavy boots, well naiced, alsu two papers of tacks.

My daily wear is an old soft hot, with ventilators all around it, a hickory shirt, a pair of denim overalls and a pair of wooden soled brogans, with rawhide well nailed on the bottom; after sundown I put on a blue flanuel overshirt. This is all the clothing I shall need till November, then I will probably want an undershirt and a pair of drawers, or a pair of cashimere pauts, with an old coat to put on occasionally.
A teat is a great convenience. Ours is of the U. S. A. pattern, $7 \frac{1}{2}$ by 10 , (cost $\$ 10$,) plenty of room for four to sleep in.
I would add to the above, a fnll set of apparatus and chemicals for the reduction of ores.
I have, probably, been somewhat liberal in my calculations for supplies, but at this distance from civilization, it will be well to be amply provided against contingencies.
I will conclude this letter by giving a few incidents, such as are daily occuring here, and which will give your readers a better idea of the country, than could be obtained from three times the same space devoted to descriptions

## incionets.

I will mention some circumstances which often occur on on this road: Last week a man from San Bernardino via Los Angeles, came on to the Desert Springs, with a riding horse and a mule packed with grub and tools. He turned them out at night, as usual, and in the morning they were mis sing. He soon found their trail leadiug directly across the Great Mohave Nesert towards San Bernardino. He procured a horse and started after them. The horse gave out after going fivemiles; he tied him to a bush and then started on the run, barefoot, on the burning sands. He ran about 3 - miles, and then erawled back almost entirely exhausted. He had no food or water with him and had he continued on an hour longer he never would have got back. His animals probably perished, for it is supposed to be impossible to cross the Desert without carrying food and water for animals.

A Mr. Wall, from stockton, came in last week from Slate Range. He had wandered from the trail, on a very fine riding mule and became nearly exhausted ; was without food or water 24 haprs. His mule's hoof split in consequence of a break in the shoe and could only walk by bindng g the riatta around the foot and as soon as it wore off pind again. He laid down to rest two or three times and soon was asleep, when his mule toak him by the shoulder and raised him to his feet. He has been told that had he slept long he would have awakened with a heavy fever
on him, been derauged and lost. He had to leave his mule 20 miles back on the road aud come in to my tent. Alout three weeks since an ox-temster stopping at Desert Springs, went out to collect his cattle and found two missing; he rode over the halls and found two ludians and a white man driving the two before them. He gave chase, though le had no arms with him, and they fled. He drove his cattle back and sent a man to tho Company of Soldiers, then stopping at Grape Vine Springs, ti ied to get them to go out and take the party, as they had plenty of horses, but the soldiers would notstart a foot. T'wo wecks since my partner wishing to come here from Slate Range, started in the afternoon, expecting to travel all night, as all try to do in crossing the dry alkali and salt fakes between this place and that. He traveled with a man who had a two-horse team und a light wagon. Towards morning they unhitched their horses to let them rest or browse, and laid down themselves. They soon concluded that the horses would travel off for water or food, and they turned out to hunt them in the dark. My partuer, half asleep, soon espied two horses moving towards Slate Range, and he ran around and came in ahead of them and yelled 'whoa!' "just as he voticed two $\mathrm{m} r \mathrm{n}$ on the horses, with their revolvers pointed at his head. They had noticed his movements and were rearly fur him, supposing him to be au Indian. The sound of his voice showed them that he was no Indian and he soon explained his object and mistake, and the travelers passed on.

A few days since five Indians came into camp at Laurel Hill, about starred. They were a portion of the party who went from Tehachapa to assist the Owen's River Indians in their late war with the whites. They cannot go to 'Iehachapa, where their squaws are, as the residents will kill every one of them, and they will wander about till some parties not so tender hearted as ours, will use them for rifle targets.

Night before last Mr. Griff Williams was Jying in J. A. Talbott's cabin, reading a paper, and feeling something crawling on his whiskers caught it and squeezing it he felt a sharp pain. On opening his hand out fell a large light green scorpion, which had stung him on the fore finger. He immediately applied wet tobacen. The whole hand swelled some and pained him for three hours, then ceased and in the moruing he could find nothing but a little black spot, where the sting entered.' This goes to show that they are not dangerous. Perhaps at a later part of the sea:on, they ma
be more poisonous.
Mesqutt Springs, June 15, 1863.

## A CAIIFORNLA INVENTION.

The Stockton Independent speaks of a new "Harvester," a Colifornia invention, in successful operation on a ranch about two miles from the Wat rloo House on the Calaveras. This machine is the invention of a Mr. Marvin, and with the labor of three men and 12 horses, is able to cut, thresh and sack the grain produced upon ten to twelve acres, per day. On the loth inst. its day's work resulted in the cutting, thresling and sacking 300 bushels of wheat. The machiue was built with more reference to durability than ornament, yet is neat and as light as the character and amount of work it is required to perform, will permit. Its cost was nearly $\$ 1,200$. The machine is said to work most admirably and has been endorsed by all practical farmers who have witnessed its operation, as the best in use.

## METALS.

The pr"ce of copper, at the present time, at the East, is 31 cents per pound.
Tin is selling at 42 cents. A jear and a half ago it was commanding but 28 cents in New York.
Lead is now worth 8 cents in New York. There has been an unsual demand for this metal, for the last year, for military purposes.
Zinc is worth 7 cents. About 3,000 tons of this metal are consumed in the United States, a little over one half of which is the product of domestic mines.
Iron of all kind is in great demand at the present time. The production of this metal at the East is being pushed with all possible vigor. Penusylvania pig is worth $\$ 30$ to $\$ 32$ in New York.
Cast steel, for mining purposes, in this State is very scarce aud held at 40 cents per pound. Of late, supplies have come to hand via Isthmus,, and move ordered. Steel of ordinary sizes quotable at 25 c . Nails have advanced to $\$ 450$.

- Some weeks since we forwarded ur subscribers as are in arwat blank receipts to stich of have promptly ane in arreurs for their subscriptions. Some have promptly answered by remittances of the amounts lue; others have notified as of sp cinl contracts with our predecessor, or of full payments made to him aud uot credited on our books. Where payments have thus been made, we have, in every instance, allowed them. 'I'here are quite a number, however, who have returned no reply to the bills which have been sent out. We trust all such will respond immediately upon seeing this notice. If payments have been made, we wish to be notified of the fact, so that due credit can be given; and if there are any to whom the paper is now seut who do not wish to continue it or do not intend to pay their subschiption, we hope they will notify us of the fact so that we may discontinue sending pupers to them. We do not wish to crowd the paper upon any man All the n.mes upon our list have been placed there, as subscribers, upon what we have deemed good authority If any party, not considering himself a subscriber and in arrears, has received a bill for subsc iption, he will confer a fivor by notifying us immediately of the fact. Postmasters are also reminded of their duty to return a paper that is not called for, etc.

Ir is stated that Gens. Grant and Pemberton were, some' ears ago, both lieu enants in the regular army, and belong. ing to the same regiment. They were stationed at De troit. We have also heard it stated that they married sisters The wife ot the latter, the telegraph has announced, was. killed, during the bombardment, by a bursting shell.

Scarciry of Water.-The water, from the melting snow is already beginning to dry up in many portions of the mines. The ildications are that the placer mining will be a very short one this year. The miners in quartz, however will be proportionally benefitted. What is death, or al least an important drawback to one, is life to the other,

Agid Manufactory in Nevada T'erritory.-Messrs McKeeloy, Ross \& Frazer, are about erecting an estalilisly ment in Carson City, N. T., for the manufacture of acids such as are used in the milis and assay offices of that I'or ritory. The works will be in operation in about one month from this time.
Bollina Meat.-It is the statement of Dr. Lankester who is the best anthority, that albumen is contained in al meat ; and if you put meat in cold water it gradually exudes but if you put it directly into boiling water, you produce. 1 covering of coagulated albumen around the meat, whicl. keeps in, to a considerable extent, the creatine and all th. precious products of the jaice of fle-h. The water shouli boil ; that is, it should have a temperature of $212^{\circ}$, and bi kept at that heat for ten or twelve minutes; then the heat may be reduced to $140^{\circ}$, and kept at this heat until th. whole is cooked.

Weg The valley of the Connecticat Biver will this sea son be appropriated ulmost exclusively to the culture of ty bacco. In 1860 over six millions of tbs. of tobaceo wer raised in the State, and this year the amount will probabl be doubled, which, with the price also doubled, will rende' profitable returns to the producers. Connecticut is th. tenth State in the Union in the amount of tobacco raisec

To prevent Kettues from Rusting.-Dr. Osborn sas that crusty deposits which gather on the inside of kettli used for boiling water may be prevented by placing a con mon clay marble in each kettle. The deposits having greater affinity for the marble than the sides of the kettl gather around the former and increase it, hue, while the la ter are left as bright and clear as when new.

The New Gold Field.-Accounts from Arizona are vel flattering about the recent discovery of gold placer digging on the Frio, a tributary of the Gila River. It is assertc that they equal the American River in 1848. Howerer th tray be, certain it is that good placers liave been discovere Mr. Frenberg, a gentleman of scientific ohservation, who h: mado that country it stady for years, predicted months at that the pext great gold-field would be Arizone. Still fu ther on than the previous discoveries, he says, richer di giogs still will be discovered. The facility of access and th tavorableness of the climate will place these diggings, if rich as reported, far aliead of the Northern mines:

LIST OF MINING COMPANIES HAVING OEFICESIN SAN FRANCISCO,
mumeni paying ming.

THE CALIFORNIA SMELTING WORES.
We are frequently enquired of with regard to the progress which the "California Sumelting Works "are making tuwarde the commencenent of active operations In repy to such numeruas enquares we would remark that the Company appear to be somewhat reticent upon the subject, but from conversation with several parties connected with that iustitution, we have learned che follosing facts, which, we presume, we can lay before our readers without any breach of coufidence.
The Company have erected one Reverberatory Furnace, capable of working about fifleen tons of ore a day. They do not intend to carry the metal through the refining processes, and complete the manufacture of copper. They will merely couvert the ore into "resulus," an operation which they will perform as folluws :-A givenquantity of the different ores are turned intu the furbace, the average of which must not assay over 10 or 12 per cent. The whule is well heated, and in the course of a few hours the furnace is tupped and the entire muss drawn off, in the condition of what is termed regulus, which will assay frum 40 to 60 per cent. of copper, the percentage dopending mainly upon the mixture of the ores from which it has beens obtained.

The Company, we presume, will nut commence operations until they lave accumulated a sujply of some 2,500 or 3,010 tons of ore at their works at Antiuch. They are huw purchasing ores at the rate of a out $\frac{1}{W}$ for each per cent. of copper the ore contaius. They pay for;

$$
\begin{aligned}
& 11 \text { per cent. ore } \$ 22 \text {. } \\
& 12
\end{aligned}
$$

As we understa $\cdot \mathrm{d}$ it, the Company pr fer to parchase a low, rather than a high grade of ores; which fuct, if it is a fact, will be particularly interesting to those miners whose ores rate, say from 10 to 15 per cent only. The simelting Company will pay all charces of transportation, on the receipt of the ores at their wharf, which anount will be deducted from the purchase price, on settlement. Any shipment will be assayed, and payed for within two weeks from the date of it: receipt. The Company have alrearly made considerable purchases in Calaveras, Nevada and Yuba counties. We have no koowledge of the time at which they will commence smelting operations. That time will be goverued entirely by the rapidity with which the ore comes in. It will not be profitable to commence smeltiny until about the quantity mentioned above has been received.

Ouf of Print.- We regret that we cannot furnish back numbers of the Mining and Scientire Press, containing the articles uader the head of "The Miners' Laboratury." without going back to the first of November last. The unexpected demand for these papers has already diawn upon our regular files. We have still left. however, a few complete files from November last, which will be disposed of at the regular subscription price-fuur dollars from Nuvember, 1862 , to November, 1863 . 'To those who are not able to obtain the back numbers of the "La oratory," we would say that we propose soum to reprint those papers, in a revised form. We have much other valuable matter in store for our readers, that are, and that are to come.
St. Ignaties College.-We have received a cony of the Annual Prospectus and Catalogne of St. Ignatius College, of this city. The college edifice is lucated on Market Sireet, between Fourth and Fifth. 'This literary institution was founded in October 1855, and, numbered at the close of the last term, according to the catalogue before us, 462 students. The design of the institution is to give a thorough Clasical, Mathematical and Philosophical oducation. It was incorporated A pril 1859, and is fully empowered to co firdegrees and academical honors in all the learned profession-: The faculty and officers comprise thirteen gentlemen, under the presidency of Rer, N. Congiato. The aext term comonences on the 24th of August prox mo.

For tae East.-'Two Ocean Steamers leave this port, on Thursday next, for the East. The fay rite steamer Moses T'aylor, under command of Capt. Blethen, takes her departure from Mission Street wharf, while the P. M. S. S. Co dispatch the finest boat of their lin', the Constitution, commanded by Capt. J. S. Waikins, at the same time, from the Company's wharf at the fuot of Folsom Street.. Fares will undúubtedly be low, and no duath is large number will ins prove this oppoutunity, to risit the " old folks at home."

## COPPER MINING CORRESPONDENCE.

Fitior Mining and Scientific Press:-Having recently made a trip through the Copper Regiuns of a portion of Nevada aud Yuba Cuunties, I have thought that I may be able to give you a few items that nay be of some value to your numerous readers, all of them, nearly, being either direc ly or indirectly interested in Copper Mining, which i. rapidly beconing one of the most widely extended departmeuts of Mining in he state.
At present there is scarcely a county in California but where indic:tions of copper are fuund. The copper ore, also, of each district, pussesses s me mark ed pecu iarity of of its own. There is a wide difference between the outward appearance of the Calaveras county copper and that of Yuba and Nevada. Most of the copper, in the former cunnty, is more or less mixed with slate ; but in the latter counties, with few exceptions, it is found mixed with quartz. From all nutward i dicatiuns. Nevada and Yuba promis - to turn out large quantities of fine ore.
The Wilson district, about seven miles from lincoln, is being vigororsly prospected by several parties, all of them, nearly, being furtunate enough to find the ont-crop; ings, and other accompranyments of copper lotes. Thus far, however, but little copper ore, of any value, has been taken out. They have one shaft here, sunk to about 75 feet ; but the copper ore is as ye of rather a low grade; but with proper car and uttention would be easily concentrated at the mines.

The miners at the Zinc House district. about 12 miles from Ijoculn, are also getting very flattering and encouraging prospects ; and this district, l have no doubt, will create quite a stir before long. amodg copper speculators Among the claims of this district, that of the Well Mining Company, is the best and m st promising. This Cumpany has a mats of ore, cheme thivy feel in witth, and upon this mass they have sunk a shaft to the depth of about 35 feat in one place, and another shaft, at a little distance from the first, is down to the depth of about 30 feet. The quality of the ore is inproving in percentage, every foot they go down.

There are several very good claims also, a few miles north of th Zive House district, on the Green and Downey leads ; among some of the best of which are the Liureka and Last Chance. Both of these claime are tarning out very fine ore indeed; and were it not that it is a little mixed with quartz, the percentage of copper wonld be very high. There are sereral other claims on these leads or clained to be on them, as I should have said, but they have not strack anything as yet, and I do not suppose it of any importance to give you a description of every hole the nuisers are sinking in expectatio 1 of finding copper, with as little chance of doing so as if they claimed 'relegraph Hill, and mined the satue for copper. In this district there are few other clanns which may turn out good such as the Alabama, Mammoth, Duffy, Wild Irish and Confidence.

A few miles south of the Zine Honse, is another copper district, called the Monitor. So far bat one grood claim has been found here, and that is called the Red Lead. Unlike the other claims, this cupper ore is mixed with slate, and not quartz. There is no m stake but that they lave a fine show here.

There is ove remark I wish to make on copper mining in California, which is, That at not a-single mine do they adop any method, whatever, of dressing their ore rud sep. arating it from the grongue: and with few exceptions, but little care is taken in the shaft, to blast the rock in such a manner as to properly save the ore. In several of the claims I visited, fifty per cent of the ore was lost, by bad workmanship, and forty per cent. by not dressing their ores.
It is a pity to see such a lare quantity of ore being entireIt is a pity to see such a larre quantity of ore being entire-
ly lost. In a number of places, dirt, stones and ore are all dumped together, while by following your instructions under the head of the "Miners' Laboratory." the whole could be separated with but little cost. Copper Mining will not pay unless the minfrs will adopt some plan to to save their ore Could you not, Mr. Coitos, give the miners a description of some cheap apparatns without much complicated machinery to spparate the gangue trom their ore?
T. Price.

San Fbanchsco Jtly 18te, 1863.

Corrmspondenge-Niceessity of Study and Exprriengr among Coppbr Miners.-In anoth r column will be found a letter from Mr. 'Thomas Price, descriptive of the progress of the Cupler Mining interest in a portion of Nevada and Yuba Counties, which that gentleman has recently visited Mr. P. is thoroughly posted with regard to Copper Mining in all its varicus phases, and his remarks are eminently worthy of rattention. We would call especial attention to the concluding portion of his letter, on the importance of the mauner of extracting the ore from the mines, and its proper man pulation and separation on thesurface. We have beard similar remarks made by other experienced copper miners, with regard to the wasteful manner of handling copper ore at the mines, by parties, in this state, who have had litile or no experience in suck matters.
Coppe- mining like all other branches of industry, in order to be made successful, must be conducted under experienced munagement. The lack of experience in this branch of our mining interest will doubtless prove a great draw-back to copper mining in Califurnia, for sume years to come That experience will be gained suoner or laterand all he soon $r$, in proportion, as uar miners take the trouble to embrace all the means at hand to inform themselves with regard to the nature and modus opercundi of their peculiar calling. Scientific bonlis are but of small account in accomplishing this end. What is wanted is proo ical information from practical men. That iuformation We are endeavoring to collect and spread before our readors. The letter we pulbish to-day and the article ander onr "Miners' Laboratory" of Ju:e 29 th, will be found especially important in this direction.
Otber articles will follow in due time, as we may be able to collect them from various sources. Probahly but few of our readers:re aware of the difficulties in the way on this Coast, or the time required for obtaining information of this class which may be realy valuable. A multiplicity of duties, always attendant upou the starting of a new enterprise of this kind, has thas far prevented us from hestowing that attention upon our editorial labors which is desirable, and, in fact absulutely necessary, to make our colomss usefol. The encouraging and incressing favor with which our efforts have secently been met gives evidence that we shall soon be in a condition to make this paper, what such a journal shuald be, an judisponsible companion to every one to. gaged in mining.

The Mart L. Gardiner. - We have tazen considerable pains to ascertain the facts in the case of the rep. ated sudden advance of the stock of the Mary L. Gardiner, as given in our Esmeralda Stock Report of Jane 29 th and July bith. Letters from responsible parties in Aurora, assure us that there was no foundation whatever for the reported discovery of rich tock, or advance of that stock. Oar correspondent writps $\mathrm{a}_{\mathrm{s}}$ that he was imposed upon in the matter, by one of the owners in"the claim, "who has always, heretofore, bees ooked upon as a reliable man," and that be should take due precaution that such an occurrence shall not be repeated. We have reason for believing that our Stock Repors for outside localities has been as correct and reliable as is consistent with the unsettled and fluctuating condition of ach markets. Our chief Pegret is that our corre-pondent has not farnished as with the nome of the party who has sought to, thus surreptitiously, make an improper use of our columns.
Mexican Ores.-The Steamer Oregon, which arrived on Wednesday last, brought up from Cape St. Lucas, 600 alacks of silver ore and 286 bars of unparted silver aud lead.

Rice Copper Discovery.-The Ione Chronicle has the following: About one year a : 0 , Johnson \& Co., and MeNeely \& Co., of this place, discovered rich copper croppings near the old Boston store, on Dry creek, about two and a half miles nortlr of Ione. As the ledge is on the Pico Grant, the discovery was kept quiet uttil the title was confirmed, when McNeely effected a compromise with the proprietors, and conmenced sinking a shaft on his claim. On the 8th of July, at a depth of two feet from the sarface. a lode of very valuable ore was struck. The vein is about five feet in width, and clearly defined. This lode is thought to be the richost yet discovered in the state, and runs through our town.

## THE MLINING SEAARE MARKET．

The Mining Shavs Market，during the rast week has quite ressmed its wonted activity．The transactions have ouen large and generally at well sustained rates．
The shief excitement of the werk has been connected with the Ophis＇This stock opened at $\$ 2,400$ ，is decline of 330．Hisputches were rectiverl，on I＇lursdity，that the mine hat heen seriously dunaged by an ext nsive cave which commenced in the Stexican mine，adjoining，and grabuatly lextrnding int，the lower salleries of the Ophir．In conse－ quence of this intelligence the stock gr dually fell to $\$ 2,000$ ． hater and offeial advices are to the effect that but com－ parative little danage hus been dune．The loss of time at the mene will not exceed a week，while the supply at the hills is full throe menthes ahath．The res itt of this later Enteligence has bern to produce some improvemut．The losing quutations ure \＄2，02i．Four handrel and eighty four shares have chaugel hands dari g the week．
Gould \＆Curry shures have improved sonewh it，with mall transactions，however．An improved dividend for the resent month，is now morn conflently expected than ever Chollur haz materially improved－as high as $\$ 1,072$ hav－ ing be＇$n$ paid to fill time contructs．We quote at $\$ 060$ ．
Hale \＆Norcross is quoted at $\$ 1,900 @ \$ 2,000$ ．Far her developments，at this mine，＂re anxiously looked for． Considerable husiness had been done on Buckeye shares， levil＇s Gate Jistricl． 856 shures have changed hands at 14．＂This has been the＂funcy＂of the weck．
Ebsmrariba Stonk has been considerably delt in，a fluctu－ ing and generally falling ratez．
Wide West has been quite active at declining rates． hares open at $\$ 165$ ，advanced to $\$ 175$ ，and closed at $\$ 150$ avorable reports are received with regards to prugress on he artesian well for this mine．
Silver Hill has been largely dealt in at prices verying from 85，50＠$\$ 55$.
Esmeralda is offered at $\$ 20$ ，Utah at $\$ 65$ ．
sheba，declined from ${ }^{2} 450$ to $\$ 160$ ；recovered to $\$ 28 \overline{\mathrm{a}}$ ， his extravagant change is attributable to th．fact that the res from the s＿mine，although very rich，camot be worked iy any process in this country．
I）e Soto．dull at \＄70；Reese River，$\$ 1 ;$ Josephine，$\$ 9$ Bhe Ridje，（El Lorado，）udvanced to $\$ 17$ ；Melunes，dull at 05 ；

## COPPER．

We have nothing specially new in Copper．
Hiphly encouraging a＂counts are coming in from Del orte connty．The Drummend Co．，Richland District，are pading down very rich copper ore，largely mixed with black fide．The Cumpany is sinking a shaft on a three loot bad，and have commenced two tuanels to open their mine．
The Pearl alsu in the same district，has a three foot lead hd are taking out rich ore，carrying much red oxide of cop

Street rumors reach us of new developments at the Evoca Vo have learned no particulars，but understand they are mportant．

A New Kind of Rock from Rhese Rivbr．－The editor the＇Ierritorial Enterpise has seen a sample of rock tuken fom a ledge in the Reese River country，which promises b be of great value as an assistant to the mining interesta is apparently a peculiar species of soap or free stone，soft nd easily cut with a knife or saw，free from grit，and re－ probling in appearance the mottled red and white pipe stone garried at a single point in the heart of Dakotah Territory nd ield sacred by all the Indian tribes east of the Rocky Ionntains．This stone can be cut into any desired form ith trifling labor，and is said to resist the action of fire as pmpletely as the pest fire brick．Should it prove to possess 18 qualities claimed for it，the cost of erecting fornaces in rat region will be materially reduced－

The fifth quarlz mill for Reese River is on its way to that TW silver region，and a large train of freight wagons is on rad for the same locality．

## ESMERALDA stuck LIST．

Ansio Our usual kismeralda let er having tailed to comse to hand，we cuntinue our last week＇s quotations．

Fine Paineng and Tall Cuinney．－A beautiful paint－ ing in oil colors of the famous Gould \＆Curry mill has been on exhibition，the past week，in the show window of Jones， Wool \＆Co．，on Montgomery street．This is one of the most complete establishments of the kind in the world ；and the painting is a most superior piece of artistic work．The tall chimeey which towers high over the building，is 115 ft ． in hight，ten feet square at the bottom，and four at the top． It hus a handsome cut stone base ten feet high，and is cap－ ped in like manner．The chimney is a nice piece of work－ manship，and is an ornament to the mill and a credit to the establishment．

Railroad Bridge．－The Sacramento Bee of the 14th insi．in noticing the progress of the work upon the Pacific Raihoad，says the piles for the bridge over the American have ulready beeu driven for a fistance of 400 feet into the river and that the plogress，and the mowntains of ready framed timber on the ground and on Front street Janding， give promse of the speedy spanning of the American by the bridge and track of the Central Pucific Railroad．

The Washor Stock amd Excuange Board，according to the Territorial Enterprise，is in an exceedingly flourish－ ing condition，with a liberal amount of cash in the treasury． It numbers fify－five members，has an elegant cabinet，and a handsomely furnished room，twenty－five by thirty feet in dimensions，which is soon to be materialily enlarged．

The Wide West Artesian Well is now down between forty and fifty feet．The Esmeralda Star is informed by the Superintendent that the water lad materially increased． As soon as the proper connections are made to apply steam to the boring apparatus they wil progress rapidly．＇Ihe company has ou hand allits necessary fixtures to extend the Aatesian to the lepth of lisu feet．

Ond age is a relentless tyrunt；it forbids tho pleasures of youth on pain of death．

## TREATMENT OF SULPHURETS.

Plather's Chlorine Clas Process for Treating Anriferous Sul plurets. as Employed by Mr. Deetken, at his Metallurgi cal Works, on the San Bruno Road, near this City.
We lad the pleasure, a short time since, of paying a visit to the Metallurgical Works of Mr. G. F. Deetken, on the Sat Bruno road, ahout two miles suuth from this city. Mr. Deet ken has established bimself at this puint which is convenient of approach, both by land and water, for t'e purpose of work ing auriferous sulphurets, alter Plattner's well knowa process but by mechanical appliances of his own invention. By thi process, Sulphurets or pyrites, are worked 10 within an al most unappreciuble percentage of a fire assay. Sulphurets have bern brought to these works after they lave been unce worked, (imperfectly, however, as they alnays will be in un sekilful hunds, and afterwards subsitted to the most carefu and olaborate pan process for amalgumation. The-e same sulphurets, so treated, have subsequently been submitted to treatment by Mr. D. with a result more reumerative, eve than that first cbtained at the mill.
Mr. D. hes made this business a sabject of much study and experiment, the result of which bas been the reduction to pructice, on a large scale, of the well known labratory pro ceas of disolving gold with chlorine gas. Hence the process employed by him it known as the "Chlorine Gas Lrocess," fustead of the "Hydrocloric Process," as stated in a previous is:ue of this paper

## description of the process.

The sulphurets when received at the Labratory are roasted pt a red heat on a reverberatory hearth, until they are com "pletely desulphurised, and the arsenic, if any is contained, fs pretty effectually driven off. This operation requires from 10 to 24 hours, according to the nature of the naterial to be operated upon, the or lusing about 30 per cent. of its priginal weight by the operation. When the roasting is completed, the ore is removed form the hearth to a tank, Where it is slightly moistened. After remaining a proper length of time in this condition, it is again removed to a large vat, capable of containing from three to four tons of the roas'ed sulphure:s. This vat is colstructed after the manner of a filler, and is filled with the ore to within about six inches of the top. A cover of wood is then pluced upon the cistern and carefully luted to render it, as uearly as possible, gas-tight.
The vat, thus prepared and charged with the ore, is now feady for the introduction of the chlorine gas, which is nanufuctured the usual way, and passes into the rat beneath the ore. The gas soon finds its way into and through every part of the entire mass of ore, and of course, comes in contact with every particle of gold, however fine, which, the de;sulphurising process of roasting has liberated from its mechanical and chemical connection with the iron, sulphur and arsenic, in their several combinations. By this process every particle of gold thus liberated, is changed into a chlorine of of gold. When the impregnation is fully completed, the sover of the vat is partially lifted and a stream of water turned in upon the top of the ore, covering it to the depth ff about six iuches. This water immediately commences percolating downward through the mass, dissolving in its
passage, the chlorine of gold, which it takes along to the bottom of the pat, hrough the filter, and is discharged through any convenient orifice, into a leading trough which deposites the liquid into a number of carbuys conveniently arranged for its reception. The gold thus held in solution is then precipitated by sulphate of protoxide of iron. Wa. ter is continually beinr passed hrough the mass of ore to the vat until the test tube shuws that it no longer bringe away gold. The test is very simple and will not fuil to detect the smallest appreciable quantity of gold, even in a large qua:
no
The above process is both simple and effectual, and may safely he pronounced the most perfect and simplest mode of extracting gold from sulphurets yet introduced into this State. Persons interested or curious in such matters will be pleased with a visit to, and an examination of these wo iss. Quartz miners will do well to call upon, or otherwise communicate with Mr. Deetken, upon this matter. The'e are but few mills in the Sate working aurifeous rock who will not find it to their advantage to have their sulphu rets for treatment, under this process. Mr. D. will tak pleasure in showing visitors through his works, explaining the modus operandi, etc. He will also exhibit, in operation, an approved apparatus for seperating the sulphurets from the ore, at the mill, and for a cost of, from $\$ 50$ to $\$ 100$, will furnish said apparatus and provide experienced parties for setting up the same, at any mill, where the pro prietors may be desirous of concentrating their sulphurets Neither power nor clean water are required to operate it.
Mr. D. is now making arrangemen's for working silve ores, a full notice of which, will be made as soon as the neerssary improvements have been completed. It may be proper, in this connection, to state that the process employed by Mr . D. for extracting grold from its ores is not applicable to silver.
Great Salt Mine.-It appears from scientific investiga tions that the salt deposit at New Iheria, Louisana, is of the most ixtensive and wonderful description, rivaling, in all probability, both in extent and purity, the famons, though recent discoveries in the Humboldt region. A late account says:-"Imagiae, if you can, the pranite of Massachusetts. or the marble of Vermont, to be solid deposits of pure rock salt, cleau and trausparent as so mach clear white ice, in one solid, inexhaustible mass, nederlying the earth, and you than acquire an imperfect idea of the vastuess of this salt forma tion."

A Good Summar's Work.-The La Poite Mountain Messenger of t': 18 th inst. says that the Campbell broth ref Chandlerville, near La Porte. took out about $\$ 4,000$ at their first washing in May; cleaned up again about the first of July, taking out $\$ 9,700$; and expect to take out as much more at the close of the season. In addition to this over a thousand dollars was taken out of the sluiges in the spring Allogether, this makes a pretty good summer's work.

- Soldeirs' Vote.- 'The roll of the soldier's names entiled to vote at the next general election, in this Siate, has been filed in the office of the Secretary of State. It is two han dred feet long and cuntains about 8,000 names.

## THE INTERIOR OF THE OPHIR MINE

The local reporter of the Tervitorial Enterprise, paid a visit to the Ophir mine, on the 14th ins ant, une day before the recent extensire "cave." We give the f. llowing extracts from his report of tlat visit :-
We entered the "north mine" through a tunnel in the icinity of O , hir office. and traversed it through H dless drifts and shatts, and climbing down from level to level, on dizay and uncertain ladders, which seemed to rest on solid dankness. We even saw the "Ophir horse," which h.s gained such celebrity on the Pacific corst, a d we cannot say that we were altogether satisfied with it.

We saw the old Virginia ledge, also, where it is cut in a tumel, and there is nothing in it-not even quartz, And we saw a very chrious thing, in the shape of a broad ledge of red, rotten quartz, runuing east and west, straight across the Comstock vein! it contains a trace of silver-about twelve dollars to the ton. Here and there, in the countless chambers of the no th mine, excellent ore is found, but as a general thing, the lead is not near so rich here as it is further south. We went down to the fifth level, and passed under the Spanish mine, reached the main Ophir south of it. Here, vast quantities of first, second and third class rock are being excavated, day and night. A drift has been started, for the purpose of striking the rich streak of ore recently found in the Spanish onine; it will have to be carried fitty feet further before the object can be accomplished. A weary decent of an app rently bottouless staircase, brought us to the lowest gallery-the sixth. It was sloppy in some places, on account of the stream of water struck in the back ledge, four or five monthe ago, and which continues to flow in considerable volume. From this depth - 313 feet below the surface, Mr. Wilder sunk a shaft a hundred feet deeper, but struck water, and had to abandon it. The Latrobe tunnel, however will drain it betore long. The Ophir mine is in superb coudition. and under the watchful care of its ufficers, all its concerns proceed with the smoothness and regularity of a faultless machine.
It may not be out of place in taking this "inside view" of the Ophir on the 14th., to take a review of the same ground as it appeared the day after

> the late cave.

At half past 10 o'clock, on the morning of the 15 th inst., 50 feet, in length, of the Mexicain mine, from top to bottom, ( 215 feet, ) caved in-that is, the opening, made by dritting out the veiln was closed up by the top wall falling in upon the bottom wall, of course, crushing down the timbers. A small portion of the Ophir, adjoining the Spanish- 50 feet of the fourth gallerg-also caved with the latter. The lower gallery of the Ophir, as we understand it, is still in good order, and persous can pass from the northern to the southern Ophir, directly under the entire cave in: both mines.
The Mexican Company will be obliged to sink a new shaft through which to work their mine, while the Ophir will not be inconvenienced beyond the necessity of clrmoing out a little rubbish, which will occupy a small protion of their force five or six days.
The cave, it is suid, had been expected for several days, and might have been avoided by filliny up a portion of he open space with rubbish, which would then have acted as a pillar, of large extent, and been an ample and permanent support for any weight that could have come upon it. The two extensive caves, which now have nccurred on the Comstock ledge, the first, some months since in Gold Hill, and the second one in the Mexican mine, shou d operate as a caution for property securing the extensive workings which are now being opened in that region. Large caves, like the two alluded to. can always be uyoided by a niere modicum of torethought and precaution.

## MEINING CORRESPONDENCE.

Notes of a Trip to Slate Range vía Los Angefos and El Paso.-Ne. 7.

Mesquit Springs, July.1, 1863.
Mr. A. Mc Pherson, of the Slate Range Mill Co., former'y at 426 Davis Street, in your city, spent a portiou of last Friday with me, on his way to San Francisco. I learn from him that the mill is how in complete running order, but water is so scarce they camot make full time, until they receive and lay down the pipes to bring in the water from another spring near by.

## another important devflopment.

This company bas fully demonstrated the fact, that the grese-wood, which is abundant every where on the desert, is a first rate material for making stean. This fuel prodaces such an intense heat, that stemm can be raised and the entire machinery of the mill started in fifteen minutes! Steam can be easily kept up by the labor of one man employed to break up and shovel in this fuel.

The importance of the discovery, to this region, can scarcely be estimated. Up to the time of making the above experiment, all calculation for steam power had been based upon the supposed becessity of contracts of from \$35 to \$t0 a day for wood to be hauled a distance of some sixty-five miles. Failing to find any one to take a contract even at such terms, the Company, as a temporary alternative, took their own team and weut to work hauling in the grease wood with the above result. The total expense will not exceed $\$ 25$ per day.
sales of feet.
The first sales of mining ground in El Paso District, was made on the 2Sth of May last, at the office of C. W. I'appan, Mesquit 6 prings. 1240 feet on eight different lodes, changed hands for the sum of $\$ 1,000$. All concur in the opinion, that $\$ 5,000$ would have been a nearer approximation to their value; but the young man who sold, had his mind set on a counubial engagement, which was to be consumated about the 4th of July, and was determained on selliog. Since that transaction, several other sales have been affected, at at prices rangiug from 50 cts. to $\$ 0$ per foot.
I intend to give in this paper some data in regards to labor to be expended in opening these mines, that I judge will be interesting to working men of small means. We all realise the importance of labor in developing our claims, and feeling our helplessness, for want of means and strength, we are willing to diride with those who feel disposed to furnish those means and help. Holders of the best claims in the district, now offer one half they hold to purties who will simk shafts on them so as to determine whether they will pay to expend further labor on them. Messrs. Keller \& Banning, capitalists of Los Angeles, have taken from fifteen to twenty leads in that way, and have opened some of them, but have suspended operation from dfferent causes. First, they had about twenty-five Mexicans, at about $\$ 25$ per month and found, and three or four Americans. The Mexicans soon became disgusted with the excesive labor under the burning sun, at climbing from five to eight miles to their work every morning, and the small pay.

The Americans were affected in a similar manner, and went to prospecting, fiyding that they could make more in a day at that, then they could in months in the tunnels. The manager, Capt. Moore, has gone down to Los Angeles to make a new start. They will make a rich thing of it, if hey go on ; provided always, the lodes are valuable, and if they are not, a great many experianced miners are most egregiously sold.

I wish the fact promulgated, that these opportunities are open for working men who can raise sufficient means to bring mining tools, provisions and strong muscles into the district, say in August or September. Say three unite, with $\$ 100$ each, buy provisions and tcols for three months, as per memorandum, in my last letter. The cost will not exceed $\$ 15$ each, to Los Angeles, besides freight. Then they can put their freight on a wagon, at five or six cents a poand, and walk out as we did, living on our own provisions, and thus, less than $\$ 20$ dollars will land them here. When they arrive, they can look at the mines and go to work, or they can prospect for awhile and see which will pay them the best.

There is a party, talking abont putting up quartz m.chinery
on a water power at Tahachapa, and another is talking of putting one up here. We hare millions of acres of greaswood,
witli which the Slate Range Mill Co. are so plensed We have also plenty of water, and at Grape Vine Springs, right miles Sou $h$, there is a sufficiency for six mills, with an abundance f fall.
Mesquit Springs is nearly the centre of the district; while Laurel Hill, fifteen miles North, at the nothern extremity of the district, may have the richest ludes, bat fuel and water are scarce.
I have sent to Laurel Hill for specimens from the leads which have been opened there, to forward to you, and hope til get them soon.
There is a splendid water-power at Oak Creek, forty-five miles Sonth, for half-a-dozen mills, and plenty of fine timber. July 5th.-Yesterday morning I started by moon-light, at four o'elock in the morning, and walked to Laurel Hill. applied for specimens, but the miners hesitated to furnish them, as they prefered to wait till they go down on the lead. They are now doing only the days work required on each claim to hold them. I succeeded, however, in securing a few, which with others from this district, I will send you by first conveyance.
C. W. T.

In connection with the above letter, we compile the folloving from a letter from an occasiunal correspondent of the Bulletm, of this city, and published in that paper on Wednesday, last :

## EL, PASO DISTRTCT.

Late assays of cre from El Paso District gives as follows: Of the Ophir, $\$ 1,155$ per ton of silver; Laurel, $\$ 200$ silver and $\$ 76$ gold; Newport and La Plata, $\$ 370$ silver; Mont-
ville, $\$ 15.5$ silver. Tarious other about the same as the Newport.

## shate range district.

In the Slate Range listrict, the Antrim has assayed all the way from $\$ 500$ to $\$ 3,000$ silver. Several toms of ore from this lead liave been shipped to San Francisco, which paid big. Of the Kenebeck, which is near the Antim, no assays, I believe, have been made very lately-at least no returns bare been received here. Those made, some time since, gave $\$ 300$ in silver per ton. The croppings of this lead are said to be 60 feet wide. The Rockland lead gave, from a select $\S$ pecimau, $\$ 2,700$ silver per ton. The Albany, owned by Searles \& Co , who have a mill on the ground, is paying well-gold. The Knoxville has hundreds of tons of ore on the surface that will pay $\$ 200$ to $\$ 400$ gold. The Portland-silver Iead-promises well The Comet, a spur
of the Kenebeck, and the Robert Emmet, both yield of the Kenebeck, and the Robert Emmet, both yield excel-
lent rock, and are thought to be rich. lent rock, and are thought to be rich.
tie colorado river mines.
At El Dorado Cañon, on the Colorado river, the principal lead is the Teschalticup, which, as I wrote you long ago averagel? from five assays orer, $\$ 2,900$ per ton, as they get
down on the lead. The Monitor, in the same district, assaye down on the lead. The Monitor, in the same district, assays from $\$ 600$ to $\$ 1,200$ silver. There are other leads in the canon equally rich with the Monitor, but I cannot give the figures. The Rock Springs distrht and the Chimawayo
district, further down the river, have demonstrated to district, further down the river, have demonstrated to con
tain rich leads; definite results I have not at hand. The Apache Chief Copper lead, still further down, near La raz, is exceedingly rich, assaying, I understand, 85 per cent. of cop per the ore is to be shipped to San Francisco. It is about and the ore is to be shipped to San Francisco. It is about
30 miles from the river-beyond. The Salizar and the Scotty leads, near La Paz, are also rich.

## other mining distriets.

The copper mines of San Antonio, just over the line in Lower California, are very valuable, as they are near water They pay. The owners already have nearly 100 tons ready for shipment. I belive a schooner is now on the way down there for a cargo of the ore to take to San Francisco.

Accounted For.-It has been noticed that the number of marriageable joung women coming overland, this year, is much smaller, in proportion, than heretofore. The Editor of the Humboldt Register, accounats for the circumstance from the fact that the young ladies accompanying the emi grant trains, are so weary and foot sore, when they arrive at Humboldt, that they readily assent to the intreaties of the Benedict miners in that out side settlement, to remain and become wives!
Treasure Export.-The excess of treasure shipments, this jear over last, up to July 20th, was $\$ 4,939,678$.
An Expensive Bumding.-The new Metrapolitan hotel,

Ubefut, And Contement.-H. H. Bahcroft \& Co. have lain upon our table a new publication, very useful and con venient to miners and others in this state. 'The work haf been compiled by H. B. Congdon, Esqu.. and is put up it a neat duodecimo form of 90 pages. The compilers prefuce
which we appeud, is fully descriptive of the plan and ohjec which we appeud, is fully descriptive of the plau and objec of the publication:
"The present volume contains all the laws and decisions which relate to Mining Corporations in the State of Ca ifor Mia; also the necessary forms used in the incorporation o
Mining Companies. It is published because of the great ne Mining Companies. It is published because of the great ne
cessity of such a work. Many thousands of men in C'alifor nia and Nevada Territory are directly engaged is mining and thousands more are owners of mining stocks; many mil lions of capital are invested in then and nearly the wholi bas ness of California and Nevada 'lerritory is busel or mining interests, jet comparatively few persons know any thing definite about the laws which govern these great in terests. T'hese laws are simple and easily understo od.
The professional man wi 1 find the present volume of grea convenience. as all the mining lans are compiled in their p or er orter, and the decisions of the Supreme Court bearing the subject are arranged under appropilite heads. most approved forms used in the formation of companie and a full and complete index are appended, and there wil be no occasion for looking beyond the present volume fo any law, decision, or form which relates to the subject
To the great number of individuals who are members, incorporated Mining Companies and owners of mining stocl as well as those who may become interested in like companh this little compilation presents an oportunity of acruining perfect knowledge of the laws which govern the sulject. their interests.

To persuns who may desire to form Mining Companies gives complete instruction and will enable them to con mence and perfect their organization without legal advice, assistance."

Chinfse Mecuanical Skill.-The skill of the Chines in many of the mechanical arts, is wonderful. We are a sured by a gentleman of this city, who has had extensive of portanities to observe that singular people, in their shop and homes, in the familiar and confiding relation of a relif ous teacher, that the accounts we read of then in this parti ular, are not at ail exagerated As an instance of their ski in one important branch of industry we have before ne, ; this present writing, the account of a meeting of the Ma. chester (England) Philosophical Socity, something over year since, at which, Mr. Fairbarn, the President, exhibite two large pans of cast iron, made in China, which wee ased there for boiling rice. The metal, at the strougest par was only one-tenth of an incli in thickness, and possessi considerable malleability. The President remarked that tl art of making such large castings, so thin and perfect, w: unknown iu England.

An Improved Drilling Macmine.-Mr. J. S. French. this city, says the Bangor (Maine,) Whig, who has been California for some years, and is now on a visit home, h invented a machine by which the common hand drill worked by one man with three or fonr tim+s the rapidityar, execution obtained by the old sledge striking operatio We saw one of his machines, (manufactured by Messl Hinckley \& Egery, ) at work yesterday. By turni g the bi ance-whee of two fect in diameter, which is doue with mu ease, the drill is struck by. a twenty-five pound sledge, fro sixty to ninety times a minute, and penetrates the harde granite as fast as four men will do it by the ordinary proce: The machine is intended for quartz-mining operations, wh horizontal tumels are to be carried into the bowels of gold bearing hills, and it can easily be arranged so as drill in all directions. It appears to be an important bor saving invention.

Rice Qeartz Ledge.-The Nevada Journat, of a ls date says: A rich quartz ledge, situated near Omega, fri which some picked rock, pounded in a morter, has yield the rate of $\$ 5000$ per ton A mill to cost about $\$ 7,01$ has been contracted for, to be put up immedialely. It
supposed about $11 / 2$ tons of the richest rock will pay for some of the most prominent men in this city are engaf in, and are owners of it. The company was incorported $\tilde{J}_{1}$ 11th as the Tecumseh Ledge Co. We have seen some s) cimens which appear exceedingly rich.

Dangerous Character of Black Petroleum.-The Cily Register, in alluding to the recent fire, states that pet leum, in bulk, is very dangerous after being recently agitat Any movement of a large quantity brings up the benzc which is the lightest quality of it, to the top, and into 1 atmosphere. This is an inflammable gas. The slight contact with a flame sets it off in a flash. Bulk oil impr kind it ignites and explodes.

LIST OF MINING COMPANIES HAVING OPEICESIN SAN FRANCISCO. | mivinken PAyFit MISTS. |
| :--- | :--- | :--- |

A.s Ivtehisting justurkiki-An ancient enpper pit, has recentry been opented at the Purtnge Mines, Late sulperiur, Which, in some respects, is the most remarkable relic of nn nuknown race of miners, who worked the copper ludes of that region centuries ago. 'The Lake superior Mining fiezelle snys:
The ancient miners have worked down on the hanging wall sinde about ten feet below the suface of the rook, where further progress was prevented by an almost continous thoor of
coppres. The cupmer in this an is coppr. The coppry in this fluor is exeectingly pere and missive: and most singular of all, many of the lately expused faces bear evidence of having been cul with some smat sharp instrmatht.-. These marks are distibetly visible in sevrat places, the marks and impressim, ths being as cleur and shaty as if made within the past year. This, we heleive, is the first is, lance where it was apparent that any of the anel ent min. ra had tools of sufficient hardne s to take out eopper even ufter being considerably suftened by the action of fire. It is quite evident that, as in almust every old pit which has been upened in the country, tire has been the agent used to soften the metal before it was cut off, as the rocks hear oviidence of catcination. Several stome lammers have also benn taken out of the waste rock and earth, which has heen piled in the pit, and peicesul' birch bark and burnt wood have bepo found mixed As yot the pit is ouly partly cleaned ont, and we may expect to see uther curiosities and pecularitios when the dehris is all removed. Another interesting feature is the fact that the bottom of the trench is nearly one continuous bed of copper.
Pnotograpiz.-Wonderful, indeed, is the progress which has been made within a few years in the photugraphic art. Photographers have taken both the sun and moon when in an eclipse, and most mportant olsservations have been made upon the latter orl, by magrifified phutographic ubservations l'hotographe:s have even caught the impression of a shell whizzing throurh the air from the mouth of a 36 -inch mortar they lave caught the wave as it breaks npon the slore; they have also distinctly depicted the dripping from its toppling erest ; they have even secured a "good impression" of the head of a criminal, in mid air, as it fell from the guillotine into the basket below! Photographic book marks and visiting cards are now sold by thousands in every important town, white photographic shirt stud and vest buttons, ornamented with microscopic miniatures, are daily produceld, in imıense quantities at the button factories of Europe. Even the most delicate steel engravings are now reproduced by the pho'ographic art with a distiuctness and finish, that threateus to entirely destroy the profit of publishers of fine engravings. A superb English engraving which was recently proluced at a cost of $\$ 50$ per copy, has recently been photographed and sold at, from 50 cen's to $\$ 2$-so perfect was the photngraphic copies, that they effectually destroyed the sale of the printed engravings. Quite a number of expensive English prints have been thus "pirated" and so serious bas the practice become, that sui's forinfringments have been introduced and sustained, and danages awarded. The English courts lave finally decided that the statute applies to the copying-by any mode-of copyrighted prints; whether a potograph was of the same size of the orignal picture or not, the statute was equally applicable.

Mineral Discovery in Marin County.-We have before us a sample of ore, obtained from Marin County, which, according to an analysis by Mr. J. H. Churchill, of this city, ontains

| Sescuioxide of Chromium. | 42,0 |
| :---: | :---: |
| Oxiles ol' Yron. . | 40,5 |
| Alumina.. | .15,0 |
| Silica. . | . .2,5 |

This ore will probably be very valuable when San Fraucisco chemical munutactures are further developed.
Candles, wax aud green backs, dyuing aud bleaching wilt eacl lay it under contribution.
The Temfscal 'Iin Mines, sitauted in the mountain range 60 miles east of Los Angeles, are probably the richest mines of that metal, in the world, and would probably have been in active working condition long ago, had it not have been for a dispute between contesting claimants with regard to title. Ine case is now pending in the Southern District Court of the United States, for Culifornia. It has already been argucd, and the decision of the Court will soon be rendered. We may look with much confidence, for early and important develupments from the " Califurnia, Tin Mines" after the decisiun, above refered to, has been duly reudered.

## THE MINERS' TABORATORY-NO. X I. SILVER.

Silver is the whitest of all metals, and is capable of receiviug a lustre inferiur ouly to polizhed steel. It is exceed ingly malleable. and in ductility is next to gold. It is harder than either tin or golld, but less so than copper. When pure it may be easily cat with a kuife, and in that state melts at a full red heat. When fused in an upen ressel, it absurbs oxygen in large quantities, sometmes amounting to over twenty times the rolume of the metal itself. On couling to the deyree of solidity, the oxygen is entirely expelled.

When silver is heated to redness, in cuntact with porcelain or glass, the absorbed osy $e n$ combines with the metal to form an oxyd, which, uniting with the silicic acid of the sabstance with which it is in contact, gives rise to the furmation of a yellow enamel. When heated vtry strongly in a blast furnace, it gives off sellsible metallic vapors. By fusing a large quatity of silver, and afterwards allowing it to coul very gradually, cubic and uctidredral crystals may, on piercing the sulidified crust aud ruming off the still liquid metal, be ubtained: silver dues not adsurb osygen at ordinary temperatises, but speedly becomes blackened on a xposure to an atmophere containing the most minute traces of sulphureted hydrugen gras, whech is decompused by it with the greatest facility.
Heated to redness, in contact with the caustic alkalies, it does not become in the least affected, and is for this reas n frequently emplised for mak ay crucibles to be ased when attacking various substances by caustic putash. Iu the presence, however, of fused alkaline silicates, silver ressels becomes acted on, and the silheate is stained of a yellow culur. Oxyd of silver is reduced by heat alone, and a globule of metal is thus obtained.

Unless in a state of extreme division. silver is sot attacked by hydruchluric acid, and eiven then requires to be heated to the temperata e of ebulition, befure the decumpusition of the acid is affected. By dilute sulphuric acid no effuct iproduced, but when strong sulpluric acid is eroployed, it is, when aided by heat, readily decompused, with the formation of sulphate of silver and the evolution ot sulphuruus acid gas. Nitric acid readily attacks silver even at ordinary temperatures; binoxyd of introgen is evolved, and nitrale of silver is produced. By chlorive, iodine aud browine, silver is, evet in the cold, readily attacked.
Silver is found not only in a pure or native state, but in a great variety of combinations with other metals and substances, forntiug no less than t-euty-three distinct species, already recognized and described by mineralugists and chemists. We shall attempt o so deseribe these various minerals, and their action under the simplest tests, that those not versed in the sci nce of miueralury cin hardly fail to distinguish one species from another, and to ascertain to what species any silver mineral they may find should properly be referred. It is importunt to bserve, homever, that the siuple silver minerals, as with those of other metals, generally occur in the veins in mixtures anong themselve; a d other mineral species, so that it is uot always pussible to so separate them that each may be recognized by its peculiar char acteristics. It is only here and there, generally, that specimens with the characters well-marked and distinct, can be found.

In the apper portions of mineral veins, where the air and moisture has had access for ages, a certain amount of decomposition bas taken place among the minerals, and new combinations have been formed, which may be termed scoondary ures. These are general more earthy, and highly colored than those in the deeper parts of the rein, being more inter mingled with salts of copper and lead, and peroxyd of iron Such ores, in Mexico, are generally known as colorados, es pecially if red, and in Pera as pacos. 'I he ores from a greater depth in the mine which have not been affected by the access of air are more brilliant and black and are called wegros.

If the gangue or vein-stone is of quartz, as, for example, in the Comstock vein, Washoe, this remains a porous mass, or "ledge," aud is more or less free from valuable minerals at the surface, being a mere skeleton of the vein, and valuable chiefly as an indication of riches below. With ores of the precious metals, the cavities of outcrops of this character generaliy contain more or less of the metals in fine grains or dust. which may be collected by pauning, as is well known in the case of gold quartz.

Many of the simple mineruls of silver are very seldom met with, and ure not of conumical msportance. Accurdingly, division has been made, an I the most important ores will be first described. Of this class, the most common mineral izing elements are sulphur and antimony. Chlorine and bromine also furm important compounds, which formerly were only known as mineralogical curiosities, but have since been found to be abundant in some of the Mexican and South American mines. It is possible therefure that some of the cump unds now so rare, may hereafter be fuand among the most important and productive ores.

THE MINES OF LOWER CALIFURIIA-SAN ANTONIO
DISTRICT. DISTRICT.
The above mines are located near the Eastern Coast of the Penensula of Lower Culifornia, and about one hundred miles north o Cape St. Lucas andare not over twenty distant frum good anchorave, in Ventina Bay, to which a good road has been cunstracted, and is now in use. 'Ihe mines of this district were the first ever worked in the Tervitury of Lower Califurnia. The existance of the precious metals in these munntains, had been known to the parly Mexicans long previous to the middle of the last century, but it was ouly at about chat time that any atteation was paid to working them. The missionaries had previutsly discouraged any a tempts of the kind, as likely to introduce trouble and disorder into the conntry.
About the y ar 1750, Don Manuel Ozio, a man who had acquired mue , wealth in the Pearl Fisheries on the coast, coumenced extensive miving operations in this district, by which he added largely to his fortune. About this time, a Castillian, named Marone, also discovered and opened the mine nuw known at the " La Marronena," being named from its discur rer. The two gentlemen ahove named, were consilered the wealthiest men in that part of Nexico. The first uamed paid $\$ 36,000$ in one year as the Goverument's one-fifth share of the returns of his pea 1 fisheries. This muney was paid in "ores " extracted from his mines.
It is said that Marone lo ined the Mexican Guvernment, during a space of two years $\$ 1,000,000$, sll of which was taken, during that time, from his "La Morronena" miue. There are now some twenty mives. being opened hy Sall Francisco capital, in a portiun of this di trict cumpzr.sd within a circuit of es- thau fifteeu miles, aside from them fully three times that number are held by Mexicans. This district is fully equal in value of its mineral wealh, to any similar district in $t$ e world, not excepting even that traverseal by the ramous Comstuck vein in Washoe. The range of mountains intersecting this district rans uearly North and Sonth, their nort ern drection being a little to the East. This mountain range is trav. rsed by three distinct leading veins of highly metaliferous ore, running nearly parallel, and some two miles apart. Upon these several veins, are located the claims alluded to, each full claim comprising 2,600 feet, and subdivided, by Mexican custom, into twenty-four shares or parts.
The middle vein appears upon the surface as three distiuct leads, which, in all probability, uuite at no very considerable depth. The most iuportant locations upon this vein, commencing on the North, are the San Nicolas, San Pedro, La Fortua, La Codicia, Peua, La Solidad, La Marronena, La Mina, Me dociua and Molina. The two first mentioned, the sixth, and the last belong to a company of wealthy Mexicans, residing chiefly in the City of Mexico. This is probably the most wealthy and extensive mining company in the world. In addition to the four mines already named, belunging to this company, they also own eighteen other mines in ither localities, but all lucated on the Penensula of Lower California. This latter lact, is rather significant of the high estimation in which this portiou of Jexico is held, as a mining region by the capitalists of that country. The six mines, above enumerated, as not belonging to the Mexican Company, are under the control of San Frap̣cisco capital, and are all being vigorously worked.
We have before us the first report of the Superintendent. R. C. Jacobs, Esq., of the Pena and Marrionena mines, from which we learn that most gratifying progress is being made upon both of those mines. About 100 cargoes of very rich ore hare been taken out of the latter, besides thoroughly cleaning out the old workings, putting down a new slault, erecting houses, etc., and making all necessary preparations
now in this city, brought up with him thirty sacks of ore, which is to be worked here, as a trial lot. I'his ore may be seen at the office of the sec etary, Wm. Faulkuer, Esq., No. 411, Clay St: eet. No ore has yet been received from the Pena. The preparatory labor, however, fur getting out ore is nearly complete
The first of the re-locat ons in this district were made, about four years since, by the large Mexican Company, at ready alluded to. The greater number, however, were onade last Summer and Fall. The early wolkers of these mines, abandoned them during a revolutionary period that occured many years ago, the precise date of which, we have not now at hand.
We shall resume this subject in our next issue, g ving some account of the aucient manner of working these mises, pecaculiar characteristics of the veins, country, etc.

## THE CUPPER EXCITEMENT.

Rvidence, corroborative of our recent remarks in riferenco to the existence of nudue excitement with regard to copper, is already beyining to reach us. We copy the folluwing siguificant paragraph from the Grass Vally National of the 23d. iustant :-
The fever for prospecting has abated, and instead of the extravarancies in which our people indulged a fbort time. since, as to accumulating fortunes in a few weeks time, copper and other interests are properly viewed, and men an longer become enthusiastic over the discovery of mundic or verdigris, nor du they take such indicatiuns as indubitable eridences that a Union or a Napoleon copper mine is dear the surface, to render them fabuluas rewards for a few days labor. All the prospecting excitements of this cuuntry have had their reactions, generally disastroms in their character, but that of the present is ful of healthful signs. As we predicted last Spring, a majority of the reported copper discovereis hereabout have proved themselves worthless, hut. this prospecting developed numeruus rich copper fields, and from many of the claims but recently opened fine qualities of $\mathrm{cu}_{\text {, }}$ riferous ores are now being shipped. The amount of p ospecting here is at present less than it has been fur the past' six months; while more sulstantial work, with better laborrewards, is being performed than at any time during oar residence in Nevada coanty.

Coso Mines.-Nems of late date from the Josehine Mine, report another rich strike, with strong evidence that it will. coutinue so.
The Mayflower, at a depth of thirty-five feet, is taking out rich rock, and have three tons at the Lotta Mills, awaiting its turn to be crushed. An assay, said to have been made: oul average rock, taken from this claim, by Messrs. Kellogg, Heuston \& Co., gives $\$ 1, \bar{n} 7$ in gold and $\$ 26$ in silver. This lead is situated one mile from the Lotta Mills, and cuntains 1,200 feet,

Richer than Ever.-The National, puolished at Grass Valley, says that the Allison Ranch Company has recentlg, struck ruck much richer than any hitherto fonnd in that fa-, mously rich lode. The discovery was made at the buttom of their 400 -foot incline. The National says it will be crusked in a few days, and predicts that it will astonish even those familiar with that inmensely rich mine.

Iarge Yrehd.-According to the Territorial Enterprise, the Ophir Company took out, within a fraction, $\$ 200,000$ during the month of June. 'This would be equivaleut to about $\$ 142$ par foot. 'The above yield won!d indicate an early advance in the per centage of divideuds of this cumpany.
Divars have already succeeded in securing $\$ 50,000$ worth of gouds, and raised one box coutaining $\$ 31000$ in specie. from the wreck of the Anglo-Saxon, off the coast of Noval Scotia. They also brought up one hundred and sixty dead bodies, and caused them to be buried on shove.

The Business os a Scholar, -To talk in private, to think in solitude, to iuquire or answer iuquiries, is business of a scholar. He wanders about the world without pormp or terror; and is neither known nor valuaed but by men like himself.

LargeLump.-A nugget weighing $15 / 4 / 4$ pounds has been picked up near Columbia, in Tuolumne county.

## THE MINING SHARE MARKET.

The activity in the Miniug sthare Markot, for the past twelk, lima beea quite equas, wany simbar preceeding persud. Whe tralliactions embrace a large number of atuchs, though thetly.cultined to th se that are paying dividends or rapidy billnuachag lat print.
Livuld de Curry shares bave not been dealt iu. Holders are lemandug siv,uvu with buyers at 35,500 . a dividud of blou per luet was declared un saturday.
Uphar has been largeng dealt in at thetuating rates. 'These Hanes upened at $₹ 2100$, advanced to 82,300 , but declined to家,, uv iu cousequetuce of sale of July dividend at $\$ 30$ atd Sio per fuut.
savage remains at about the last quutations. Lfforts are feing imate to secure mill fiechlties for working the ore. hat that end is acconplished, und dividends placed in early reopect, but litele witl be dune in dins stuck.
Chullar still continues lo advance, and is quite in favor, fat watu limited tramsactions.
Irausy shares have been quite aclive, but at declining rates. The murket opreace at $\$ 310$, shmulated by recent advices of avorabie inucutious an the cumpary o mana tumel. Shares ubsequently declined to $\$ 2 \$ 0$, upun rumumers of a luw uivifeud tor the commg month. ## COPPER.

There is an evident lull, at the present time, in the Copper pxcitement, throughout the state. This quie ude, however s indicative of an approaching healthful condition of that ranch of industry. It is a rest from an undue and freazied ttack of Cupper-mania, which will undoubtedly result in huch good by awakeuing prospeetors to the necessity of a proper development of their mives, rather then rushing to lapitali-ts with a few surface indications, to sell "feet" at pig prices. Our people are begining to learn that every furface indication, does not lead to a well founded and payjog vein of copper. Such indications, however, are true |tarting points, which, as a geveral thing, may soon be defeloped into paying veins, or prove worthless to follow. The results of legitimate explorations have already satisfied apitalists that the State is rich in copper, and no doubt heed now exist, but that California will soon take rank as he first copper producing country on the glube. It is not lecesary, to this ond. that every copper mine should become Union or a Napoleon; neither should our miners set down nd take it for granted that there are no more such mines of
copper to be found. Let thom continue their explorations in an energetic and legitimato manner. Tha: chances of snceess in copper, in this state, are undubtedly greater than thuse in any other metal.
The Union is muking daily shipments of ore. $\$ 2,000$ per fuet is asked for the ouly stock in the market.
Newton is progressing sluwly, with no stuck in the market.

Copper Hill is improving, and is now held at $\$ 10$ per share. 'laking ont about trea tons of ure per day.
The Napoleon is progressing finely. A third level is now being run at a depth of 165 feet. The veiu at that depth is 1t feet. Upwards of 100 tons of oro huve been shipped to his city wi hin three weeks.
The Keystone is alao shipping ore and being efficiently worked.
Reports from Carmen Island, are that a large and true vein of ore las been struck.
'There are six Copper mining districts in Butte county. The Fiurest lode, in the Kentucky Ranch llistrict, it is said, yiekls ore containing 60 per cent. of netal. The lode is three feet widu.
In Calarras county, work is rapidly progressing on the Empire, C'alavaras, Lancba Plana, Josephine, Camp \& McNilty, Collier \& Hughes.

## WHEELER'S Amalgamating and Separating Pans, <br> It is acknowledged by all who have examined the principles aud wituessed the operation of these Pans, that they are decidedly superior for tritura mating purposes to any other in use. <br> The mast important principle connected with the operation of these paus is the separation of the trituratiug process from th tof extracting the amalgam from tho sand. The chief cause of hiss of che precious methals :urisand. The chicf cause if hiss of toe precious methls arr- ses from the passing of of the sume in combination with the quicksilver, during the proces of trituration, and in the quicksilver, during the proces of trituration, and in cleaning up By the iutrodnction of the Separating Pan cleaning up By the inlrodnction of the Separating Pan to follw the trituration this loss is entrely arnided. In working these machines there is do appreciable loss of Forking these machines there is no appreciable loss o quicksilver, and heace none of the precious metais. Where these l'ans hare beet infroduced and operated by the side of others on sands from the same by the side of others on sands from the same vat, the Wheeler Paus have uniformly gailied a large percentage Wheeler Paus have uniformly gained a large percentage of metals over its compretitors, as well as a still larger parcoutage in the amount of work performed, *** These Pans man be scen in duly operation, at the Miner's Foundry, on First silreet in this city, where all nterested are invited to call and examine for themselves. 2016-tf ZENAS WHEELER.

## AN IMPROVED FURNACE.

Mr. Edirna:-The folluwing quotation from Wells' Scientific Annual, for 1863 , gives many details of improvements regured for converting fuel into a gaseuus form before its application to heating. This furins the basis of one of the Nurwegian methuds for the treatment of Copper pyrites. It will therefure form a uacful prelude to what I hope to send yon, shortiy, on this suliject. In the recent Intermational Exhibition, in London, metal was exhibited manufactured by this means, in other parts of Europe. Instend of the fireplace of the common reverberatory furnace, a 'gas geverator' is employed.
"This consista of a circular chamber of fire-brick several feet deep, and two or three feet in diameter, closid at the bottom, and having a hopper at the top, through which the fael is supplied. This chamber, at a certain height from the bottom, is in direct connection with the body of the furnace so that flame may issue as freely from it as from the fireplace of an ordinary reverberatory furnace. In the sides of the generator, at a certain distance from the top, is a series of three or four small, round holes on the same level, and at some distance lower down is another similar series of round holes. These holes are for the passage of the air intended to support combustion in the interior of the generator, which is blown in either by a fan or some other convenient blowingmachine." Now, when the generator is full of incandescent fuel, and air is injected through the lateral holes, carbonic oxyd gas is copiously produced and passes into the furnace as there is no other place of egress, the hopper at the top being suprosed to be shat. As it escapes from the generator, it is met by a current of heatedair, or as it is tecknically termed, 'hot blast,' which is injected downwards from the froof of the furnace at or near its junction with the generator either in several jets or one continuous sheet. The carbonic oxyd whil still hot is thus burnt, with more or less air at will. The air which supplies the generator is also previously heated; and in the Swedish furnaces the apparatus for heating the blast consists of a scrios of cast iron pipes fixed at the lower part of the stack. Hence only the waste heat of the furnace is employed for this purpose. It is usual to place a hollow cylinder of iron romd the generator, so as to leave a closed space between its internals sface and the exterior of the generator; and into this space the hot blast is introduced, whence it passes through the two rows of holes previously described into the interior of the generator. The atmosphere of such a furnace can be rendered either reducing or oxydizing at will hy regulating the amount of blast. At the botiom of the generatur is a door, by means of which the ashes or clinker from the fuel may be withdrawn. These furnaces can be so modified as to suit any kind of fuel. A recent writer in the London Timrs adrocates tl:eir use even for the burning of antliracite. He says, "Ihis kind of coal gives intense local heat, but this iuconvenience might easily be remedied by introducing along with the air into the generator a certain proportion of steam. This steam would be decomposed, with the formation ol carbonic oxyd and hydrogen gases and some carbonic acid, and a considerable re-
duction of temperature would be the result. But the heat mained hirlden for centuries. The work was recommeneed thus removed 'rom the chamber would be subsequently re- under Trajan and Adrian; still later, by Frederick II., in stored in the borly of the furnace by the lurning of the com- 1240 ; by Atphonso I. of A rragon, in the seventeenth cenbustible gases derived from the decomposition of the steam, tury; and, lastly, hy Frederick I. of Naples, in the eightso that there would be no Irss of heat, but only a transfer eenth century; but all failed. But matters are not quite so smooth the lake was as far off as ever At length, in 1853, a Neaas they used to be, and necessity is berrinning to comuel at- politan comprny obtained permission to drain the lake, and tention from s ur iron-masters to the sulject of economizing take the reclaimed bed for their remaeration. On investifuel in every possible way. The old reverberatory furnace gation, it appeared that the tunnel constructed under Clauis only a clumsy sort of gns lurnace; but in the Swedish dins had not been so planned as to draw the water from the peat-furnares the fuel may be converted into combustible lake. The Emperor was cheated by his Minister of Public gas, which may be applied under the most advantageou conditions.'"

A Poor Chemist.

ANCIENT AND MODERN EFFORTS TO DRAIN LAKE FUCINO, ITALY.

Those of our engineers who may traverse Southern Italy in the course of their travels this year, will find an interesting work proceeding in the northern provinces of Naples-in the Abruzzi-not far from the frontiers of the Roman States, in the works for draining Take Fucino. This lake consists of a
vast pool of water entirely surrounded by mountains. From vast pool of water entirely surrounded by mountains. From
very remote periods, attempts have heen made to drain it without success. Iast year, on the 9th of August, a company, founded by the Roman banker, Prince 'Torlonia, after eight years labor, succeeded in tarning tho waters of the Iake into the river Liri, which flows into the sea, near Gaeta. through a tunnel about four miles in length. When the drainage arrangements are complete, nfarly forty thousand arres of excellent land will be brought into cultivation and thinty thousand inhabitants of the mountains, who are every year driven by the snow storms to take refure and seek labur in 'Fuscany and the-Roman States, will find employment in the diained bed of this lake. "Julius Cesar planned the dranage of Lake Fucino." says an Ttalian wr ter; but the Einperor Claudius made the first attempt Pliny descrihes the wonders of a tunnel following the sides of a mountain at it depth of a hundred feet. And it was, in deed, an astonishing attempt in those days, when the engineers lad none of the appliances of modern science. Claudius employed thirty thousand men in the attempt for eleven years, and exhausted the public treasury. When he believed that his work was complete, he celebrated the event by one of the greatest naumachia, or water fights of the Roman times, in which nineteen thousand men, divided into two flects, fought to the death, "to make a holy day." Clandius. Agrippiua, and young Nero (who, a few months later, becane master of the Empire, ) the imperial court. and an immense crowd of spectators, were present at th.is ferrful and impos ing gladiatorial contest. When the play was plased out the dam which stayed the waters from the tunnel was re moved, and they rushed in with a roar, but soon bailed back The tunnel was a failure! The cause of this failure re

Works. The engineer of the modern company finally decided to destroy the Roman work, and make one of double tho dimensions. Our account dues not come down to the final completion. We suggest the subject to the attention of young tourist engineers and our illustrated periodicals.London Journal of Gas Lighting, April 7.

Casting an Anvil Block, Weigiting One Fundred Tons, at the Midiand Works, Sheffield.-Messrs. Stanley \& O., iron fouders, Midland Works, were occupied the greater porton of Friday in casting a monster anvil block, weighing one hundred tons-by far the largest casting ever made in England. At an early hour the workmen were busily engaged at the furnaces and in the foundry getting everything in readiness for the actual operation of casting, which began about eight o'clock, and continued under the personal superintendence of the Messrs. Stanley, until three o'clock in the aftervoon. The mould-to the uninitiated only an immense hole in the earth-was situated in the centre of a spacious cisting room, having on each side a powerful crane, by which the mol'en metal was conveyed in ponderous "ladles" from the furnaces to the mould. As the burning flood rolled into the fiery pit, sheet of flame and clouds of smoke rose seething and scorcling from the mass, and innumerable stars of strange beauty and brilliancy darted forth ill every direction. to the manifest disquiet of the more curione spectators who had approached venturously near the spot. There were many gentlemen and several ladies present, and great gratification was evinced at the scene they witnessed-not forgelting the manly reudiness and energy with which the grimy and perspiring workmen performed their important and often dangerous parts. A bont a quarter past two oclock the "dross" which had accumulated upon the surface of the metal in the mould, now almost frill, was dragged off, and the top of the mould closed over. the remainder of the requisite metal being poured into it through a central aperture. The metal run from two large cupolo and two air furnaces. The anvil is intended for a $121 / 2$ ton Nasmyth's double-acting steam hammer, resti, g ou a found tion of oak blocks, eleven feet square by four deep, and one hundered and twenty large piles driven ten feet into the ground by stean power. The hammer is for forging the hamogeneous metal for the large Whitworth guns and projectiles, marine engine cranks, and other shafts weighing from five to eight tons each.-Sheftield (Ing.) Tel.

## MINING CORRESPONDENCE.

Ei, Paso Mining District, Los Angeles Co., Mesquit Springs, Joly 12th., 1863. $\}$
Messrs. Ewer \& Smith:-On Friday, the 9th. inst., Sackett's Express arrived from Los Angles en route for Salt Range, and brought me a finelot of your papers posting me np to the date of No. 34 .
On Saturday morning I walked to Ophir City, fifteen miles from here, situated at the extreme north end of this district, to see what was going on there, and obtain specimens for your cabinet. I started between three and four in the morning, lost the trail, but found and followed the wagon road which made my trip three miles further than by the trail.

I found there six camps pitched around in a square of an acre of ground; on the side of the mountain called Laurel Hill, with a fine spring at one corner of the square, at an elevation of 150 feet, or more, above the plain.

I find the task of collecting specimens far more laborious than I expected, but I intend to persevere till I have a goodly number in your hands.

T hope you will label all that I send, that they may make a fair show for our district.

As the cost of forwarding fifty specimens would he but a trifle more than for twenty, I shall wait till I have gathered all I can conveniently, and will endeuvor to give a discription of their appearance.

There are but three lodes being developed at this time. These are the Milliken, No. 1., Manzanilla and Newport, and but little has been done on them, as they are approaching them by tunneling and of course can show no rock from below the croppings. Work will be commenced on the Tucker or "Iron Clad Company"s" lead saon. It is so hot here, (July 14 th., 10 A . M., the thermoneter shows $108^{\circ}$ in the shade.) that men cannot work outside, so nearly all are laying off, waiting for help and tools.

## C. W. Tappan.

Humboldt.-Where are our Humboldt correspondents? We have not heard from them for some time. We have learned incidentally however, that several letters have been addressed to this office, and that the writers are complaining of their non-appearance in our columns. The letters referred to never came to hand. There is a screw loose somewhere; all right, however, at this end of the line. We hope soon to be able to post our readers again in regard to the condition and progress of mining interest in Humboldt.

The United States Tunnel and Mintng Company.-This Company have been long engaged in prospecting their mine, and are now about to be rewarded for their toil and expenditure. After running their tannel 1,600 feet, they have now strack rich quartz in veins of about six inches in diameter, with every prospect of soon reaching the main lesd. About $\$ 30,000$ have been expended upon their tunnel. Enterprises of this cbaracter deserve a rich return.

Copper Mining about Mount Diablo.-The work goes steadily on, and in a number of claims the owners seem to be on the eve of realizing a full reward for their labor. Very fine specimens have been shown us from Mount Zion. and we learn that the company have several tons of ore sacked ready for shipment. The Keokuk, Last Chance, and a number of others, including the Hall claim, in Alamo District, have obtained the most encouraging results thus far.

Santa Clara.-The news from all the prospectiog companies in the hills aronnd Santa Clara is encouraging. At Lexington they are progressing, and are sanguine of striking the vein. Bituminous coal of an excellent quality has also been struck, and no doubt is now entertained of its being in paying quantities. Several influential citizens of this place have been out to a copper discovery-the Savage claimand a company is formed to thorouglily explore and develop it. The prospects are said to be better than they were at Copperopolis.
The oil springs at Lexington, it is said, are to be developed, and an excellent article of crude oil has been brought in from the springs,

THE PLAN OF CREATION.
BY PROFESSOR AGASSIZ.
The animal life of our globe shows that it has been formed with the design of bringing forth man as its last and highest creation: The bistory of the earth during those inconceivable periods of time before the human race was created has been traced by the united laboss of astronomers and geologist.
By the theory of Laplace, which is now generally accepted, it is supposed that the solar system once existed as a nebala, a vast distended flat mass of fiery particles of matter, revolving upon its axis. As it cooled it contracted, and threw off rings on its outer edge, like the rings of Saturn. These were then drawn together into globes of molten matter.
Between the time at which the astronomical history ends and that at which the geological begins, there is a period which has not been examined, because there is no man competent to undertake the investigation. As frequently happens in sciencr, we must wait for another generation to be edncated for this work; for, learning the art of investigaton is the labor of a lifetime

Geology finds the earth in a state of igneous fusion. In examining the rocks of the eartls we find that they consist ot two classes. Those of one class are formed in layers liise the leaves of a book, while those of the other class are simple masses without stratification.

The stratifed rocks were formed by being deposited at the bottoms of seas and lakes. Let me present some of the evidence by which this fact is known. All except the very oldest of the stratified rocks are filled with animal remains: -especially with shells. Now we find these remains always lying upon their broad sufaces. If a shell falls through water and rests upon the bottom, it will not rest upou its edge, but upon its side; and the fact that the shells contained in the rocks always have their broad surfaces parallel with the planes of stratification is one of the proofs that these rocks were deposited in water. Many of these rocks now lie in a slanting position upon the slopes of mountains, but as we find the shells which they contain with their broad surfaces parallel with the planes of stratification we have no doubt that these rocks were formed and hardened in a horizontal position.
The stratified beds have been raised into a slanting position by the rocks from below being pushed up through them. The central mass is of unstratified rock, with the stratifi-d rocks laying apon its sloping sides. We know that these rocks have been raised in this manner, not merely from the broad surface of the shells being parallel with the planes of stratification, but also from the fact that we find the same kinds of rock lying one on another in the same order on both sides of the mountain.
When the unstratified rocks were forced up among the rocks lying above them, they were in a state of igneous fusion. This is shown in the fact that they have run into and filled the crevices and cavities in the stratified rocks, which they certainly could not have done if they had been in a solid state. The fact is farther proved by the alteration which they have made in the portions of the rock with which they came in contact. We know that if marble is put into the fire it will be redaced to quicklime; and that if sandstone is highly heated it is formed into coarse glass. The effects of heat upon rocks of various kinds is well known, and we find these effects wherever the mass from below has broken through the stratified rocks. There can no doubt that that mass was in a state of igneous fusion.
All over the world the highest mountains have been raised ap since the lower ones. The oldest mountains on this continent are the Capotian, extending in an easterly and westerly direction north of the great lakes. The Appalachian chain is older than that of the Rocky mountains. So in Europe, the Alps are newer than those of less elevation. This is what we should have expected if we had reasoned on a sound basis. When the hard crust of the earth was comparatively thin, it would yield to a slight force of upheaval, but as it became thicker from the gradual cooling of the globe, it would require a greater force to break it up, and, consequently, the forces accumulated and produced proportionably greater effects.

When we find one rock which has unquestionably been deposited upon an other rock, it is manifest that the one ly-
ing below was formed first; and thus we are furnished with sure evidence of the relative ages of the rocks. Ihe successive layers of rock are like the pages of a bock, arranged one after another in regular order.
Now let us take a general view of the history of animal life, as preserved in this record. The rocks of the earth are naturally divided into several classes, restigg one upon another.

At the bottom we have thie unstratified rocks-granite, scienite, trup, \&c., and above these the tratified rock; named generally from the localities in which they come to the sur-

The lowest of the stratified rocks contain no animal remains, and are therefore called azoic. But in the silurian we find four orders of animals ; the radiates of which the starfish and the coral are samples; the muluscs, to which the oyster and clam belong' ; the articulates, embracing the lobster and all insects : and even the vertebrates are represented in certain low forms of fishes. This commencement of the creation uf animal life upnn there four modes of structure shows the formation of a determained plan from the be-gining--a plan that embraced the creation of manas its final culnination.

The three lower orders are represented by all the classes which now exist, but at the beginuing there was only one class of vertebrutes, the fishes, after a long time the reptiles were created, then birds, and finally animals, to which class man belongs. The lower orders are not represented in the older rocks by the same species which now exists, hut even in these there has bren some degree of impropement-a general tendency to a higher and more complex structure.
The several species have not been gradually developed one out of another, but in each case a new creation has succeeded to the old.
The rocks nearest the monntain being the most inclined in this way, then other rocks lapping over them and less inclined, till we come to the apper rocks, which are generally horizontal or nearly so. As the shells in these rocks and other evidences prove that they were all deposited in' $a$ horizontal position, it is evident that they have been inclined one after another by successive upheavals of the mountain. The injection of a vast mass of matter in a state of igneous fusion must have destroyed all animal life in the adjacent waters, rendering a new creation necessary. The persistent following of the same plans through all of these successive creations shows the existence of a preconceived design.

Discovery of a Cave in Washoe.-The Virginia Union has the following:
J. W. Rawlinson, of Palmyra Dis't, called upon us and gave us the particulars of a strange discovery which was mude in that District last week. A party of three men were out on a prospecting tour, between the towns of Palmyra, and Como, when they were startled at making a "strike" of a character far from being anticipated; in fact, no less a great natural curiosity than a large cave. The entrance to it is by a long hall, or natural tunnel, about 400 feet in length, and varying in width from 10 to 100 feet; at several places widening into small chambers ; the sides are for almost the whole distance, of solid rock and in several places worn so smooth that it is almost impossible to believe that it has not been done by the hand of man. At the end of this, is a chamber the sides of which are rough and broken, but of great hight and size. Leading from this are four other short arenues, or balls, some of them so low that a person is compelled to crawl through them, each of them, however, widening at only a short distance into small chambers. There are supposed to be other chambers, and probably of great extent, bot at the time Rawlinson left it had not been sufficiently investigated to determine this. The most important and useful part of the discovery, however, is that there wert almo discovered, far in the interior of this immense cavern several splendid looking silver and gold bearing ledges, ani numerous excellent indications. When these facts becams generally known in the neighboring towns, great excite ment was caused, and there was a tremendous rush of for. tune seekers for the new land of promise. Claims werc located in every direction, and the search for now ones was still continuing. This adds still another to the many natural curiosities to be seen in our wonder-producing T'er ritory.

NICEEL MINE IN ITALY.-FUREIGN MINING AND METALLURGY.
A joint-stock organization for working nickel bearings at Crusino has just been formed, under the title of Boulart. Bowher is Ce. The capital of this enterprise is $\mathfrak{E}^{\prime} 9,000$, divided into 1.4 .0 shares, of $£ 20$ each. Nickel is a scarce and dear metal, the use of which is everywhere extending. The governments of Belgium, Italy and Switerland have introduced it into the composition of a portion of their coinage. and it is more especially in the mixtures with copper, tin, sine ur cobalt that it is utilized. The works which apply themselves to the treatment of this metal are not very numerous; there are some in England, one in Belyium, and several in Germany; but this branch of metallurgy has not a greater development, in consequence of the absence of sufficient supplies of nickel mineruls. Some workings of niekelifereus minerals exist in Germany and Italy, and it is in the province of Susi, in this latter country, that the Mine of Cruvino is situated. To pronounce an opinion on a mining working is always a difficult and delicate matter, as, independently of apecial knowledge, a perfect study must be made of the locality. Bat Signor Sella, engineer of the district in which the Cravino mine is found, and formerly Finance Minister, abserves: "The undersigned concludes that the works exceuted by M. Boulart have shown an arsenions vein of cobait and nickel in \& gingue of dolomite lime, quartz, and talcous and winding schists, with which it is intermingled. This vein inclines almost vertically to the West, and the metalliferous threads which it comprises vary in power from a very minute fraction to five-eights of an inch. The undersinged is of the opinion that the works executed up to the present time have presented sufficient indications of $\Omega$ mine of nickel and cobalt; and, although the metalliferous power of the mine may not be considerable, yet having regard to the high price of nickel a very small quantity will pay the expenses of extraction, and the undersigned, therefore, hopes that the Cruvino Mine can be worked at a profit, and helieves, in consequence. that it may be declared open in accordance with the terms of the 15th Article of the Code of 1814." After having indicated the analogy existing between the Carvino Mine and that of Usseglio, Sigoor Splla observes that the disenvery of veins on the extreme limits of a formation of cobaltiferous and nickeliferous veins may involve a fair presumption that a fine future is in store in connection with their working.-London Mining Journal.

## THE PYRAMIDS-HOW BUTLT.

Herodotns, who visited Egypt 445 B. C., gives us some acconnt of the herculean labor there performed. The stones were brought from the mountains on the opposite side of the valley of the Nile. The first work was a giant causeway or road. over which these enormous stones could be transported. Ten years, he snys, one hundred thousand men were employed in this part of the work. After the building of the road came the levelling of the rocky hill, the cutting out of the subterranean chambers, and the elevation of the huge masses of stone. This, the same writer says, occupied three hundred and sixty thousand men twenty years longer! 'Ihe first layer of stones were easily put in their places: the secend were elevated by the aid of machines or derricks. Then, as the heights of the mass progressed there were a series of broad steps, corresponding to the number of layers of stone; as the work proceeded, these machines were planted alang the ascent and the stones elvated from step to step.
Such is the structure we have come to examine, and which now stands before us in all its buge proportions. What an immense laborl What countless years of human toil! What a story of crushing despotism and hard earned slavish servitude! But they were built, and here they stand, and here they have stond for thousand of years, defying the wasting hand of the barbarian, the storms of the desert, and the lightnings of heaven ; looking down in proud contempt upon the fierce conflicts of human passion, and conquering nations have come to deluge with blood, and heap with carnage those beautiful plains above which they lift their lofty heads!-Israelite.

Tobacco smoke blown into to the wound is said to be a sure cure for the lockjaw.

## TO MINERS AND PROSPECTORS.

In view of the fregrent accidental discoverips of valuable mineral deposita, other than gold, in nlmost every section of the state, which have of late heen made, it is hut reasonable to suppose that prospecti gevea in C'alitornia, has but just commenced. The simplest and most universal of all metaliferons deposits is grold. It rarely occurs in uny other form than that of "rree gold" which is readily discernable to the naked eye. An examination of any rock or earth for guld is an extremely simple process. If its presence is suspected in alluvium, the simple washing of that alluvium in a pan is an invariable te-t. If in rock of uny description ; that rock pounded fine in a mortar and washed, in the same mamer as alluvium, will usu.lly expose its gold to the naked eye, if there 18 any there in paying quantity. The only exceptions, are where the gold is contained in ison pyrites, or copper pyrites containing also iron. In either of the two latter cases the presen e of gold may be readily ascertained by placing the pyrites in any suitable vessel and keeping the contents at a moderate heat for from four to six hours, with frequent stirrings, by which means the sulphur will be evaporated, and the copper, if any is present, changed to a dull red color, and the gold retaining its natural appearance, on subjecting the whole to the usual panning process, may be readily seen by the naked eye.
Not so with other metals. Silver, copper; zinc, nickel and many others appear in such a great variety of metalliferous forms as generally to defy all but the most practical and srientific eye. No description of these ores can be written which will afford any very important aid to the inexperienced in making explorations. Alter reading descriptions, however, and carefully examining the specimens described, the explorer may go out and scarch with some degree of confidence and intelligence $\mathbf{A}$ study of the characteristics of the sulphuret ores alone, would lead an explorer to pass over, entirely unnoticed, the nchest varieties of the ores known as Chlorides or Horn Silver, which, from the facility with which they niay be worked, and their usual richness, are generally considered the most valuable of silver ores. There is much reason to believe that this variety of silver ore will be extensively found in all the volcanic regions of this State. So with many other ores.
Considering the great difficulty, in the present lack of cabinet collectiors, and other means of instruction, to acquire a practical minerallogical and geological education in this State, and desirous to aid, to our fullest capacity, the development of our. mineral resources, we hereby make
the offer to $m$ ners, prospectors and all others, who in their the offer to m ners, prospectors and all others, who in their
travels or explorations may come acruss specimens having the appearance of rarity or value, to carefa'ly examine and pronounce upon the same, free of charge, as to their characteristics, value, etc., whenever any such specimens are brought or sent to this office free of cost to us. We have already been called upon in many such cases, and we shall at all times be willing to give our attention to any such requests which may be preseuted to us.
In carrying out the plan we propose, every ininer and prospector should be at all times on the lookout for any new mineral. Tue ordinary rocks with which the miner meets in his travels and labor, and which possess no mineral value are usually well known. Whenever a rock presents any unusual appearance in conformation, color or other characteristic, attention should at once be given to it. There is scarceIy a piece of quartz or rock of a quartzoze nature, which presents any uncommon appearance in texture or color that has not been thus modified by the deposit or intrusion of some mineral substance. If such rock is found upon or near a vein of quartz it should be carefully examined "in place." and if the cause of its peculiarity is not evident and readily seen, it should not be passed carclessly by: There may be value in it, although the gold may not shine there. We shall commence in our next issue a series of articles describing as accurately and as intelligibly as possiblo all the ordinary mineral substances which may be likely to come under the notice of the California prospector. These articles will be published under the head of "The Miner's Laboratory," and will be found of great value to the mining public. [Mining and Scientific Press, Ap̈ril 20.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventora should bear in mind that, as a general rule, any inventiou which is valuabic in the patentee in this couritry, is worth equally as nuct in Einctand and some othrer foreign cumutries. Four patents-American Engli-b, French and Belgian-will secire an inventor exclusive monoply to his discuvery umong one handred millions of the most :atelligent people in the world.
The facilities of business and steam communication are such, that patents cau be obtained abroad almost as easy as at home. The majority of a / patconts taken out by Americans in foreign comatries are obtained through the Mining and Sicientipic Press Patent Anancy. Haviagestablished agencies at all the principal Enrupean seato of Government, we obtaiu patents in Great Britain, France, Belgium, ment, we obtaiu patents in Great Britain, France, Belgium,
Prussia, Austria, Spaia, etu., with prumptoess and dispatch.
Models are not required in any Muropean conntry, but the utmost care and experience is necessary in the preparation of the specifications and drawingse
When partics intend to take out foreign patenta, engravings should not be published until the foreign applicutions ave been made
Caution- - It has beenane n somewhat common practice for agents located in Eugland to send out circuiars soliciting the patronage of American inventors. We caution the latter against beeding such applications as they may otherwise fall into the tainds of irresponsible parties, and thus be defrauded of their rigbts. It is much better for inventors to entruet their cases to the care of a competent, reliable agent at home.
While it is true of Most Euronean countries that the gystem of examination is notso rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee fiuds a purchaser for his invention, for the latter to cause such examioation to be made before be will except the title.

It is also very unsafe to intrust a valuable invention to any other tban a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.
Subscribe.-Are you a miner and not a subscriber to the Mining and Scientific Preses? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no papir that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MrNing and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examinamion, and with the hope that it may so for meet with their approval as to wurrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than six months ; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discoutue the paper alter being a constant reador of it tor even that short period.

Deposited for Imported Bars.
\$1 16-4-11ths. cents per standard oz. 1/2 per ct. gross alue of deposit for making bars.

THI MINERS＇TIABORATORY．－NO．XII． SILVER．
Before describing the variuls ores of silver， i ，would be best to phace before our reulers some of the must promi－ neut and characteristic tests for that metal，and in vider to du so we must suppuse that the miner has made a solu－ tion of pure silper by disoolving i in ut tric acid－dissolving， say 20 grmins in about，年 an oz．of acid，and adding 3 oz ．of pure water to the whole，and dividing the solution inte six equal parts，the iproce eding as folluws：
To No 1，add a solution of Sulphurated Hydrogen，which will produce a black precipitato or sediment．
To No．2，add Sufphate of Ammouia，which will produce the same kind of reaction as Nu． 1 ．
To No．3，add Hydruchloric Acid（Muriatic Acid or Spir－ its of Salt，）which will prodnce a kind of white curdy pre－ cipitate or eediment－this sedument will disappear on add－ ing to it a suall quentity of liquer anmun a，and will reap－ pear again on adding to it a few drops of uitric acid．
To No．4，add a solution of Chlurate of Putash which will produce you a brick red precipitate or sedinent．＇This is a very characteristic test fur silver in sulution．
To No．$\overline{5}$ ，add a Solution of Potassa，which will produce a brownish black precipitate or sediment．If you culleet this sediment on blotting paper，dry it，and heat it in a small dish，you will convert it into metallic silver．

No．6．－In this porticn place as strip of briglit Copper for a few moments，and silver in the metallic state will be de－ posited on it．

It would be well if all parties intending to test minerals for silver，would make themselves thoroughly familiar with these reactions．Uther metals g．ving alusust similar r．ac－ tions，parties，not thoroughly acquainted with the tesl：for pure silver，are liable to be misled．and to think that they have silver when in reality it is sume other metal．In order to illustrate this more plainly，we will suppose ourselves for a few moments examining the coutents of several buttles for silver．In the first place we would liabel these，No．1，2， 3,4 ，decor we would then take a purtion of $\mathrm{N} \cdots 1$ buttle and add to it a solution of Hydrochloric acid－a white precipi－ tate would lead you to think that No 1 was the buttle which contain $d$ silver in soluti in．But in reality it may be either silver，lead，mercury，antimony，or bisunuth，and our next point would be to uscertain which of these metals are in solution．This can be proved as follows：Pour the the clean liquor fr m the sediment aud boit the sedment with about $1 / 4$ of an oz of Hylrochloric acid for a few mo－ ments．If the precipitate dissolves，then it was not silver， but antimony or bismuth．Snould it not disappear，pour the clear solution awny，and boil the sediment a second time with considerable water，aay 1 oz．Should the sedinent dissolve，then lead was in solution，and not silver．Shuuld the precipitate not dissolve．pour the clean liquor away again and add to the same sediment liquor anmonia．Should the sediment tura black，then mercury，but if it dissolves， leaviag a bright clear solution，then silver is the metal held in solu ion．

In our next issue we shall describe the ores of silver and how to discover the pre eace of that metal is such combi－ nations as the miner may come across ；but we will say that it is absolutely necessary that he should first be thoroughly acquainted with the tests and reactions of pure silver as laid down by me in the commencement．

Copper Ore．－Copper ore of a rich quality has been found in British Columbia．A lead of native copper has been dis－ covered withiu ten miles of Victuria．

Tue Editor has been absent from his post during the past week ou a short trip to the copper miues of Calaveras and Amador．
Cariboo－Many of the clams on William＇s Creek，B． C．，are paying enormonsly．Some yield over a hundred pounds of gold per day．

Tee Pacieic Montrly．－The Pacific Monthly for August， is out．Among the good things contained in it，is a list of ＂The Prominent Men in California iá 1846，＂by Thomas 0. Larkin，Esq．This must be interesting to all new－comers， as well as torty－niners．
［For the Mining and Scienific Press．］
THE APPLICATION OF PHOTOGRAPHY TO MINING．
When St．Victor first made his experiments in the applica－ tion of light to seusitized surfaces，and aided by Daguerre，work－ eld out the great problem which they were buth endeavoring to solve，he little thought what an immense advantage would arise to ：he worll at large．Iroun his makiog a practical thing of the action of light upon metallic oxydes．

I he casual observer as he passes the numerous groups of of ph tographic jictures which meet his graze in almost every street，luoks upon the art as something that pauders to the vauty of the multitude，or tends to keep alive the bonds of memory Even the most practical men，those who are en gaged in the developement of the rezources of the conntry， in their hasty conclusions，deen that the work of the photis－ grapler，is but an idle occupation，and of no actual benefit ave to the operator himself．
But while the astronomer takes pictures of the sun，moon and stars ：while the mechanic obtains viers of his machin－ ery，so perfect in persbective，so accurate in proportio：and detail，that they may serve as working plaus ；and while the architect produces aduirable representations of the buildiugs he cunstructs，all，with the catnera．the mining a ngineer al－ so dues in many instances avail himself of th．same method to illustrate the advances he has made in his labors，and to show t e grounds upon which he is working．
It is seldom that the Board of Directors ever visit the mine ；the stockho ders themselves rarely travel thitherward； and all the information which they gaiu of the progress of the work，or the character of the country at the mine，is de－ rived from the terse and sentenciutis reports of the manarer． Did the manager understaud the use ol the camera，a know－ ledge which is very easily acquired，he could show trom ac－ tual views，the proyress made in his work，werkly，or monthly， a－night be desired．He could present pirturus of the mine and its surroundings，show the bearings of the outerop，the trend of the vein，the features of the idjoining country，and in fact，each，and every minutise，that would aid greatly in satisfyng the Board of the correctness of his system，and in faniliarizing ihen with the property whose interest are in trusted to his guidance．When th＝coustruction of build－ ings o：the erection of machinery is progre sing，a few min－ utes work with th camera，at the cluse of each week，will shuw the exact stage of the advance made siuce the last view was taken．So much wall has been built，so much ma－ chinery has been put iuto position，so much excavation has been made，and the quick action of the camera has told the story more pla，uly，more trutlifully，than a volume of words could do．

Much of the value of the vein，can be foreshadowed by the physical features of the country in which it is situated． If easily accessible，even a low grade of ores could be worked profitably，while those which might be very rich， would，from he expenditure necessarily entailed upon them， by the diffcaltios of their pusition，never be remumerative． Here the camera becomes useful in its correct delineations of the surface，showing to those who reside at a distance from the mine，the actual position of the vein，and the facil－ ties of approaching it．It is true，that an absolate necessity dues not exist，for these features of the mine to be presented to the notice of the Buard，but it cannot be doubted that the more fully they understand their property the better they will be able to manage it．It is not possible for all to visit the mine，and by actual inspection，and examination，make themselves conversant with ail the local details of it；but they can avail themselves of the aid of this branch of science， and briug，as it were，the mine to their own uffices，or fire－ sides，and insp et it at their leasure．Thase who have scen the views，which have been taken from time to time，by the different artists of ths State，of various mining localities， can readily understand，how greatly such delineations must aill in a correct estimate of the value of such propertie．，hy those who cannot visit them in person．Nur is at necessary to be encumbered with costly or heavy and clumsy apparatus； a light and portable camera，with the stand upon which to place it，so light，that both can be carried with ease by sus－ taining their weight upon two fingers of the hand，with lenses that can be readily carried in the vest pocket，can readily be obtained at any of the photogrphic warerooms．The writer of this article has a complete apparatus，which is packed in
a box about one foot square，containing the camera，glasses a box about one foot square，containing the camera，glasses for pictures，lenses，and the requisite chemicals；the whole of
which does not weigh over a dozen pounds．And often in journeying throngh mining districts he has stopped his mule，taken a view and in eight minutes been agan upun lis journey．
Such is the progress made in the art，that plates are now prepared which may be fopt for years，if not expmosed to the light，and then be placed in the camera，and a view taken upon them．This advancenuent in the art，precludes the ne－ cessity of carrying bulky packages of bottles and chemiculs， while travelling，trobtain good viows，and thus places it in the power of any who are so dispused，to bring back with them picturesque delineations of the scenes through which they bave passed．It can be rendered practically useful by illuatrating the progress of work apon the mines．

## CALIFORNIA＇S WANTS．

California wants two hundred thousand pair of working lands，one hundred thousand brave aud hardy men who are unither tou proud nor too lazy to work，but who are willing to labur and wait if the sure results of hunest toil．Be－ tween the grey ribs of granite，lic burried milli ns of pres－ cious metals which nothing but the strong arm，the drill and the pick，together with the aid of mechanical industry，can bring out ；but besides all this mineral weal h Califorvia offers a clinate and soil adapted to the production of all kiuds of sereals as well as Iruits and flowers，the rose and the cactus，the fig and the alnound tree here flourish；while fields of wheat and barley present to the eys an uabroken surface．With a bracing climate and Italiun skies，giving strength and energy to the enervated frame of man，we cau－ nut cunceive of too extravagant speculations as to the future of California＇s developments．Her allavial and min－ eral wealth seem to be inexhaustable－almost every day we hear of new discoveries of the precious metals－＂Struck it rich＂is the phrise which arouses whole commusities，and sways the multitude as by some mighty magnet，leaving whitening fields ready for the harvest，uncut，whole sette－ ments depopulated，houses to rent or i ir sule at low prices； such sudden outburst，s of splendid prospects，tow often disap－ point the wild adventurer，and too soou he finds that he has torn down what he had cummenced to build on a sure ba－ sis．Califoraia dues not want such a class of men as those； she has enough of these wild adventurou＊speculators al－ ready．She wants men of iron nerve and sinue，with per－ ceptive faculties to know when they are well off，and＂let ＂ell enough alone＂－men who are＂williug to labor and to wait，＂for results which will surely be remunerative to them， by application and patience．To all such，whether they come from the North，the South，the East or the West， California exteads her hands，and lids you welcoate．

## OBITUARY．

We are pained to be called upon to record the death of the Rev．Benjamin Brierly，who departed this life．July 21，1863，in the city of Nevada，Cal．＂Men die，yet their deeds live after them．＂When good men die，society feels the shock．So with California－she has suffered an irrepur－ loss，in the death of Mr Brarrly．The Church has lost a mighty champion for her rights，Vice and Irreligion，an un－ compromising foe ；the poor and despised have lost a friend， and one who would nut stop to enquire＂Of how much sin are you guilty？＂but who was ever ready to relieve the ne－ cessities of others，to the sacrifice of his own comfort and ease．Many thought him too easily deceived in his chari－ ties，but his motto was＂Better be deceived many times than to be mistaken once．＂In religion，he had a clildluke faith．Though he has found a grave on California＇s shure， far from his own native Isle，yet his confidence was in God， and thus neither time nor space could serve to soparate him from His preseace．Who would fear to die，after life＇s work had been so well and laithfully done？
A．Heavy Fald．－The Territorial Enterprise of the 21 st． ult．，is authority for the following ：－
Adam Simpson fell down the shatt of the New York Com pany， 238 feet，night before last，broke his wrist and bruised his head somewhat．Dr．Sharky set the broken bones，and the patient was doing well at last accounts．
Witain the last year over eight million dollars in gold dust has been received at the New York assay office from Pike＇s Peak．

## COPPER．

Since our Iast we hear of valuable discoveries of Copper in Maripusa，and Merced counties which are very flattering，and the mania fur locating feet unexampled．Fifteen uiles of claims have been staked off shalts bave beed courusenced and work is progressing．
In＇Trinity county prospecting continues and miners are sanguine that rich Cupper miues will soou be develuped．
From Del Norte we hear of profitable workings．The Alta are slipping ore and rapidly developing their lude； 4000 barrels of ore go forward on the Mary L工 sutton to New York．
At Mount Diablo the numerous companies prosp cting their claims coutinue with unabated zeal to turuel，aud sink shafts．
It is estimatell that the Copper mines of Calaveras county will soon uffurd permanent work to thousands of laborers． The Union continues its large yield of slippiag ore，and the tock still uppreciates in value．
The keystone has been hurgely increasing its shipments and extending its working operations．＇lue Calaver＇as and Eropire are also steadily progressing．At Camp seco the mines are doing well．＇ithe Copper Hill is shipping in fair quautities．

The Napoleon has produced this month about 200 tons of ore，and the amount is being increased as room is made un－ derground
The last assay of forty－five tous，was made at an average of 1 17 per cent； 200 tous of ore from this Uompany＂s miuego to New Yurk per the Mary L．Sutton，to sail it a day or two．The main slaft has been sunk 165 feet on a lude of 14 feet in width．
Forty tons of ore from the Celorado have been received as specimens of the yield of that district．

In Butte county several good lodes are beigg opened and Yuba we hear that prospectors are sanguine of success．

Notre．－In this State，we believe，cases of deaf and dumbare not very common，although cises of deafuess alone are so．We personally know many of the latter，where no relief has been obtained under our most skil ful physicians We have，therefore，much pleasure in dalling a tention to the authenticated cases of cure by Dr．De Castro，which appear in our advertising columns to－day．Those visiting the Dr．will find him a perfect gentleman in every respect， free from all quackery，and worthy of all confideace．

Tue Lake Superior Miner states that $\$ 100,000$ of silver obtained annually from the copper mines．

For the information of those of our subscribers who are members of any of the Temperance Divisions of this city，we are requested to state that the next regular meeting of the Golden Gate Division，will be held on Saturday Evening the 8th inst．，instead of Thursday Evening．A full attendance is requested．Their＂paper，＂the＂Golden Gate Journal，＂will be read at 9 o＇clock．

The Nautical Magazine．－Capt．John is outagain with his valuable Magazine．Capt．John has a leen eye to everything that pertains to the Sea，and is as firm as a rock

## Offices To Let,

 Olices, the most cominodinus und eccessible in the city. Eye, Ear and Throat.

## DR. DE CASTRO, Oculist and Aurist,

WHO HAS PRACTXSED IN NETV guela urrivalled suecess, und from cach place is in possession of the most cminent testimonials, may now be con-
sulted upon diseasca of these delicate organs, with a view suted upon diseascos of these delicate organs, with a view to their permanent cure. Deafners of loug standing tho-
roughly cured. The Deetur employs his (by the Medical Society of Loudno fpuroved)

## Self-acjusting Artificial Tympanum,

For the relief of deafness, antended by los or injury of the membrana yymani, mind fir the cure of discharge
from the car-the invention of Do Castro, aI, D. author of "Denfness Practically Illustrated as to its Nature and Treatment," Ptc, The self-adjusting Artificial Tympanum was first introduced to the notice of the professinn at the mepting of the
Meflieal Society of Londnu, on the 20th of N'ovenuber, M863. An animated discussion ensued on tbe reading of the paper, and sereral members of the Snciety borc testimony to the success af the remedy and the mportanee of
the original discovery. the original discovery.
Adiustiug Artificial Tympanum, as he had observed the immenso bentit a young hady fricnd of his has received from it. She was in fact, quite deaf, aud in a most mis-
erable state; the effect of the ty rapanum was instantaneerable state; the effect of the tyrapanum was instantane-
ous-quite like a miracle. Five more costimonials frum Members of the MedicalCollege, New York, and the priacipal cities of Europe.
Operating Rooms, UNION BLOCK, corner of Market and Kearny streets. Eutranco on Market street.
H3, Mr. Editor-Having been afflicted With deafness fir the last two yoars, originating from a most excrutiating pains in niy eirr, I was obliged to come dowa to San Frameisen to seetr relief. Arter a plysician's. recomendatinn to wait on Dr. De Castro, on the corner of
Kearny and Market streets, and underwent one operation. Kearny and Market streets, and anderwent one operation.
and it is with the atmost ploasure I cau suy my hearing and it is with the atmost ploasure I cam say my hearing
was suddenly and withrut painentirely restored. I deen it my duty to make this krown to the bublic, and to recommend Dr. Do Castro's skill as an aurist. JOMN REESE, Napa Vally. James Callaghan, witness,
San Francisco, July 30 th, 1868
[From the Daily Alta.]

En'rs Daily Auta. san Fraucieco, June 30th., 1863.
Pormit me through your widely circulated jmirnal. to say, that ry daughter Mary Ellen, has been aflicted with deafuess since she rras thirtren montha old, and that she
has been a member of the Deaf and Dumb Institute since has been a member of the Deaf and Dumb Institute since
it was nrganized. On takiog her to Dr. De Castro, nit the it was nrganized. On taking her to Dr . De Castro, nin the
corner of Kearney and Market Surcets, and undergoing uncorner of kearney and Marketsirects, and undergoing un-
der his direction, two operations, she lass heard sounds very distinctly, and is now, Iam happy to stato in a fair Way to get permanent relief. The result, thus far, is sat-
isfactory; and I deem this notice due to Dr. De Castro for isfactory; and I deem this notice due to Dr. De Castro for
his skill ; and would recommend all narties similarly afhis skill; and wnuld recommead all narties similarly af-
ficted to give him a trial My daughter has at different times been under the care nt the woost stilful plyssicians and aurists in California, but up to the period of visiting
Dr. De Castro, received un lienefit. Dr. De Castro, received un henefit.

Wealith of Gold Hrll, Sonora County. We clip the following from the "Sonoraz
Flag," of July 30th. "Under the energetic and capable superintendence of N. P. Turner, Esq., the Gold Hill quartz mines, immediately in this city, are developing astonishing wealth. We saw Mr. Turner with a tubfull of rocks-the richest we ever sawwhich were over half gold. Some had been broken with the pick, but so completely was it interboand by fibres of gold, that the fractured pieces refused to come apart. A
'breakdown' in the mine, day before yester'breakdown' in the mine, day before yester-
day, displayed the shining particles, on both sides and above the drift. The shaft is in the immediate vicinity of the place where the prodigious strike was made, a few years ago, and is actually on the same vein. The owners have about as good a thing as they want,
and refuse to let any of the -stock go into and refus

Rior.-We saw a small silver brick, the past week, weighing 6 oz , taken by Varney, from 50 ths. of average rock from the Miuna del Norte mine, situated in San Antonio District, Lower California, about 20 miles from Ventana Bay. This is a newly discorered mine, located by a San Francisco Company. The rock thus tested by Mr. Varney, was a fair average for arastra working.

Remotal.- Messis. Gallagher, Weed \& Co. have removed their Brass and Bell Foundry from their late stand on Oregon St., to 125 Front Street, opposite Minna, where they are prepared to answer all orders in their

Scpport Hone Manufacteras.-All home manufacturcs have an interest to us, simply because every article thus brought into our local market is an addition to the wealth and
importance of the State. For this reason we importance of the State. For this reason we
beg of our numerous readers to pay a visit to the trank manufactory of Mr. James Longshore, under the Tehama House, Sansome street, where they will find the best workmanship, and cheapest goods of the kind, in the city.
New Orfice-Messrs. D. C. Williams \& Co., Mining Brokers, have removed into their fine new office, No. 605 Washington street, be-
tween Montgomery and Kearney tween Montgomery and Kearney Sts.

Ratroad House, -Our personal friend, Mr. H. T. Furton, has lately purchased a
half interest in this Establishment. From considerable acquaintance with Mr. F., we know no man, more capable of "keeping a management, the Ranlroad Housc is second -to none, in all the requisites of comfort and
convenience, and we trust nur numerous patrons in the country, will be advised by us, and on visiting San Francisco, give it a trial.

We append in the following supplement,
a list of Miars to which we have not yet obtained the names of Secretaries, and to a very large extent, even the locality of the mine is not known to us. They will be placed in the preceding Catalogue as fast as the neccessary data can be obtained. The attention of Secretaries and other parties in-
terested is colled to the deficiency alluded to

## Zouave, $g$ and

Mr. Edryor,-I see in your number of last week a notice that "the editor is absent," and in the same columa, (page 4,) a letter from your correspondent " $P$." which implies
that uthers, also, are at times "absent." I that uthers, also, are at times "absent." I
think that your proof reader must be answerable for the assertions in reference to No 2 and No 4 Sulphide of Ammonium and chromate of Potash, although not commonly effects spoken of, but the absence of a precipitate with nitrate of silver is the test for chlorate of potash as to its freedom from chloride. Some statements however of the properties of hydrochloric acid seems, to imply 'absence" elsewhere. A. Poor Chemist.
"A Poor Chemist" is correct in his surmises, and we owe our correspondent "P." an apology for the errors which we unintentionally allowed to creep into his communication.

Dry Crushing. - Mesers. Hotaling \& Wheeler have recently invented and put in practical operation, at the Miners' Foundry, in this city, a battery of four stamps, designed for dry crushing. The battery, though quite a light one, is capable of reducing to an almost impalpable powder about four tons in twenty-four hours. We have neither room nor leisure this week to give this new improvement the description and notice which its importance demands. We shall endeavor to do full justice to it in our next issue.
Our Trip to Copperopolis.- We have been so incessantly employed, since returning from Copperopolis, in preparing our enlarged Mining List, that we have had no time, whatever, to write out the notes taken on that trip. We shall endeavor to commence their publieation, however, in our next issue.
An ingenious fellow is selling photographs of postage stamp size, with gummed backs, to be used as prima facie evidence of ownership when applied to "portable property."
Excellent clay for fire bricks, crucibles, and cockery, has been found in mining tunnels near Gold Hill, and a porrery has been established at Virginia.
New Copper Discoveriss.-Rich discoveries of copper have been made near Cloverdale, in Sonoma county, and a new mining district formed. We were shown specimens of ore on Saturday which show indications of of ore on Saturday which a permanent ledge; the copper appears of very fine quality.
One firm of hardwaremen in Virginia have paid $\$ 37,386$ freight on $946,376 \mathrm{tb}$, hauled in wagons from Sacramento, at a price of about four cents of Hb .

OUR LIST OF MINING COMPANIES.
We have devoted nearly our entire issue this week, to our enlarged list of Incorporated Mining Companies. In order to make room for it we have been obliged to issue a "supplement" of four pages. The list, in its first issue must, of course, be quite imperfect we shall take especial pains, however, to render it as correct as possible for our next is sue. To this end we earnestly call for the co-operation of all parties interested. W shall endeavor, as far as possible, to wait up on them individually during the present week and receive suoh corrections, as may be need ed directly from their hands, Those Secre taries who may be personally interested in any needed corrections, and who may not be waited upon by Thursday or Friday, will confer a favor on us by handing in their correc tions at the office,-or forward them through the Post Office to our address.

We are fully aware of the importance of the publication of a full and corvect list of Incorporated Mining Companies in the State and especially of those having offices in this city, and we shall endeavor to meet this want to the best of our ability. We hope by next week, or the week after, at the fartherest, to be able to furnish our readers and the public with a list sufficiently complete and correct to warrant its transmission to friends at the East as an occular demonstration of the extent and progress of the mining interests in the State. The issue giving the complete list will contain some appropriate remark with regard to the character, importance and value of progressive and non dividend paying mines.

Rice.-We saw, ou Saturday last, the tan gible evidence of a very rich strike in the Rising Sun claim, Buena Vista District, Humboldt. This Iedge is located about three miles from Fall's Mill, and bids fair to develop a valuable mine.

Rumor says that Joseph Trench intends to build a large theatre in Virginia, and to em ploy Charles Pope as Manager.

## Washoe Correspondence.

The following is an extract from a privat etter dated Silver City, July 22, 1863, which was been placed in our hands for publication
According to promise, I continue my corespondence, and without further statement of personal matters than I gave you in my last, I will give, as near as I can, a clear idea of the state of things in the Devil's Gate Mining District, as I know you are anxious to receive information upion which you do me the honor oo say "you can.rely." I made a somewhat longer trip through the mines of this district than I had first intended to do. There is no diminution in the flourishing prospects of Nevada Ternitory, if I am to judge by the enterprise that actuates the community of gold seekers at and about Dayton and Silver City Lore mills continue to arrive and more machinery for newly developed mines, especially for Palmyra District. This newly discovered district has, within the last few months, made rapid progress. Mavy of the ledges have
proven far more valuable than any had supproven far more valuable than any had sup-
posed or even expected. Large capitalists, find, are daily investing large sums in this disrict, by purchase into various claims. Spring vork is continued night and -day. As you taken out is from a ninety foot shaft, and will are aware this valley was prospected three or pay over $\$ 200$ per ton. They have already
Cour years ago, although little was accom-commenced the tunnel so it shall strike the plished antil last year, when many old claims ledge two or three huudred feet deep. I beWere relocated, and, up to the present time, lieve the stock is all owned in San Francisco, astonished even the owners of the oldest and at from $\$ 40$ to $\$ 50$ per share. After an exichest claims, who originally have purchased amination of this mine I am satisfied it is not It is the impressiun foot. It is the impressiun, as you are arrare, with the opinion of its big neighbor, the Daney, many men that a claim is not worth buying people. Old hands working on the Danes unless it is held at large fiyures. But men of have been unable to tell Jewel ruck from their
capital here hare given the lie to this pre-lown when placed side by side. The company sumption by immense investments here. Here have also located three hundred feet on each is located the justly celebrated Daney mine, side, their tunnel covering several ledges o $\$ 300$ per ton.

If I owned but a few feet in it a competence|through which they have to pass. I speak would be insured to me. They have a fine thus explicitly of this company as they are to mill now ranning. Its erection cost them be considered next in reputation to the Daney, $\$ 60,000$; in three weeks running thereafter and becanse they show every evidence of the they cleaned up the neat sum of $\$ 63,000-\mathrm{a}$ truth of what I tell you, and will, I believe, paying investment that, was it not? That verify my words. I forgot to state that this gave an impetuss to mining operations, and a proposed Jewel tunnel runs through the Tennultitude of tunnels were run. Many have nessee ledge, which you remember my telling struck it very rich, with rock paying from $\$ 50$ you was bought up by some parties who

## the jewell company.

And here I may mention the Jewel Com any, located near the Daney, and promising to be equally if not more valuable. In many things it possesses superior advantages over the latter company. Last week a committee
from the Board of Trustees of the Jewel Company visited their mine- I had the plea sure of an introduction to these gentlemen and with them visited their location. They have purchased a mill site from Mr. Seares to erect a fifteen stamp mill thereon. The have also let a contract for running their tun ael. The mill is to be like that of the Daney Company, which has proved to be an excel ent one. This claim is on the Daney ledge nd prospects equally as well, if not better city in few days for reduction and test. The proprietors of the Daney speak in the highest terms of their little neighbor, the Jewel, for The Hawley Co. deserve notice also; they are situated near the Jewel, and are daily ising in favor here. They have a fine encine on the ground, which they put there at a cost of $\$ 7,000$. There are others I propose
to give you a statement of, such as the Minto give you a statement of, such as the Min-
eral Hill, Chrystal Palace, Mount Hope, etc. Rest assured, however, that a few months will prove this district of which I have here ritten to contain some of the wealthiest mines in the Territory. We have a new town laid out, Geneva by name, distant about one and a half miles from Silver City and three from Dayton. Ten or fifteen houses are already erected, and more begun. However, for further statement, you mast await my oext, and meanwhile believe that I have made these notices of these claims from actual observation, and am confident that I.have not even given you half as glowing an account of our mines here as they really deserve, or will prove themselves worthy of.

Yours Truly,
L. D. S.

A silver lode has been discovered near Indian Diggings, El Dorado county.
Several copper companies at Fairplay, EL
Dorado county, are taking out ore for ship-
nent.
The Virginia Enterprise is in favor of Washoe'as a name for the Silver State. It is moch better than that confounding, confasing, and nooriginal name of Nevada.
A brick-yard near Virgiuia has capacity to tnake 14,000 bricks daily. The price is $\$ 17$ per $1,000$.
There is some talk about establishing a
large private cemetery near Virginia.
VOI. VI. SAN FRANCISCO, MONDAY EVENING, ATGUST 17. 1863. NO. 42.

## COPPER DISCOVERIES IN CALIFORNIA.

Copper was discovered in the southern portion of this state rery soun after the first iuflux of gold seekers to the Pacitic Coust. Rich mines of this metal were found to exist at farious points to the East of Fort Yumi, in Arizona 'Terrifury, and also to the North, alung the Valley of the Culora7o. Some attempts were made, at an early day, to work the mines in Arizona. hat with little success in conserpuence of nulian troubles, the dificulties and expense of trumsportaion and the ligh price of labor. We are not aware that any further aftempts have been made. since that time, to work huse mines. Recent intelligence from the Colorado, howevr. warrants the belief that the copper interest of that region bill soon grow into considerable importance.
Copper was also discovered in Hope Velley, on the Eastmolupe of the Sierra, not far from the Placerville and Carson Valley road, if our memory serves us correctly, as arly a 1855. We have now in our possession a very rich pecimen of "peacock ore," taken from the "Cnele Billy Rogers Lead," and placed in our hands in 1856. We are ot aware that any considerable amount of work was done this vein until the present year, when it was re-located, nd regular mining operations commenced upon it, in a small ay.
copper discoveries in calateras county.
In the year 1855, Mr. J. W. Bean, of Copperopolis, who as residing some three miles north of the present Napoleon pper mine, picked up some specimens of what was no doubt arbonate of copper, from a ravine near his cabiu. He took em home, and on showing them to his partner, was greeted th the remark that " they were nothing bitt copperas rocks, be country is full of the stuff, and it isn't worth a d-n." r. B. threw his specimens out of the door, among some rabsh, and by that act parted with indications, which, had they fen followed up intelligently, would have led him to a forne, and placed the State of California five years in advance where she now is in her great interest of copper mining. Farly in 1860, Mr. Hiram llughes, who had been for some ars residing in the same neighhorhood with Mr. Bean, was tacked with the "Washoe fever," aud joined in the general sh, which took place in that direction in the Spring of 1800 , 8 soon as he arrived in the neighborhood of Virgiuia City Was so struck with the great similarity of the appearance the country there, with that where he had been so loug living, fong the foot hills of Calaveras county, that he made all ssible haste back and commenced prospecting for silver. e soon located for silver and copper, what is now known as e first discovered copper mine in Calaveras county, situated Quail Hill, No 1, about three miles north-east of the Naleon mine, and some six ar eight to the westward of Copropolis.
We had intended to have visited this locality during our ent trip to Copperopolis, but want of time prevented. . We pe to do so, however, at an early day. We understand it the locality is one of peculiar geological interest, quite similar from the surrounding country, generally, and giv-
ing most unmistakeable evidence of recent, intense plutonic
action. Mr. Hughes is working his mine for gold and copaction. Mr. Hughes is working his mine for gold and copper. The copper, we understand, lies in an intermediate strata, betwen two uthers which carry gold, with silver also to a considerable extent. The working fur gold is carvied on in the rainy season only, when water can be had for working -the freo gold being thus taken out and the "tailings" carefully presirwed for future reduction, lyy machinery. About 300 tuns of copper have been taken from the mine and shipped, chiefly carbonates, which have assayed an average of 25 per cent.
Mr. Hughes was also the discoverer of the now famous Napoleon mine, eleven eighteenths of which he sold for the sum of $\$ 22,000$. We shall hereafter have occasion to speak more fully of this mine.

The discovery of copper on Quail Hill soon became noised abroad, and parties from this city went op to enquire into it. Prospectors were very soon out in various directions, hunting for "indications."

Farly in the summer of $1860, \mathrm{Mr}$. R. B. Reed, having examined the ore at Huguhes mine, started out on a prospecting trip, in an Easterly direction from Hughes'. While passing through a long narrow valley, about eight miles distant from his starting point-a locality with which he had been long acquainted-he observed some croppings, which on close inspection, he felt sure were of the same character as those on Quail Hill. He gethered up some specimens, and retraced his steps, about four miles, to McCarty's cabin, a well known stage stand on the Stockton road, where he submitted them to Dr. Blatchly, of this city, who had recently been attracted to that place by the fame of Hughe's discovery. The Doctor being something of a mineralogist, at once pronounced the specimens copper of most fattering indications.
Read, McCarty and Blatchly started out early next morning, and located and staked off for thernselves and friends all the ground now embraced in the Union, Keystone, Consolidated, Empire and Calaveras claims-11,250 feet. A large number of sacks were filled with the croppings of carbonats, which were gathered from the surface. The first work was done by $\mathrm{Dr}_{1}$. Blatchly, at what is now known as the Discovery shaft, upon the Keystone mine. The Doctor obtained good shipping ore at a depth of 25 feet. Mr. Reed soon afterwards commenced work upon what is now the Union Company's ground, and obtained good ore at about the same depth with the Doctur. The first ore shipped from this mine assayed, in this city, 30 per cent. It may be a matter of curious interest to some to state that the first work ever done on this mine was the sinking of a small prospect hole, three or fuur feet deep, by Mr. McCarty, somewhere about 1852. This small excavation may still be seen a few feet to the rest of the Keystone Company's office. The opening was made in search of gold, but without success. The prospector however, has since been rewarded by a most ample fortune made out of the same gronnd, but from a mineral of another character. It may be recorded as a matter of some what unusual occurrence, that all the parties directly engaged in these early
and valuable discoveries held on their ground long enough to become independently rich. In our next issue wo shall grive some acconat of the prugress which has keen made in the development of these mines.

## OUR MINING STOCK COMPANIES LIST.

We hope to be able to place before our readers, in our next issue, a full and corrected List of the Mining Sturk Companies haring offices in this city, and, to a large extent, lucated in other parts of the Pacific coast. We have already corrected a great number of errors in our last, and made many additions. We have devoted to this work almost the entire labor of three men during the past week, and we yet find much to do. A more general co-operation of Mining Secretaries, would greatly facilitate the work. While we cheerfully acknowledge the generous and willing aid of some, we regret to say that there are others who appear to take but little interest in a work which is of such evident importance to the entire mining community. We trust that all such, after our next issue, will realize the importance of the work, and hereafter lend a more willing hand in aid of our efforts in this direction. Single copies of the issue containing the Directory, will be furnished gratis to all of our regular subscribers, and additional copies will be supplied to such at the regular subscription price. Twenty-five cents per copy will be required of non-subscribers, for that issue. Persons interested in the development of the mineral resources of California, can do mach in aid of that work, by purchasing and forwarding to their correspondents, at the East the index of this recent mineral developments of the Pacific coast. The record shows an extent of operations and evidence of mineral wealth truly calculated to arest and fix the attention of capitalists in the Kastern States and Europe. We shall send the proposed issue to the leading banker at the East and to all other prominent capitalists whose address may be at hand.
Our " Miners' Laboratory."-In our articles on "Silver" in our "Miners' Laboratory," we do not porpose to confine uurselves to what are strictly called silver ores, but intend to place before our readers, all the minerals contwining silver whether they are copper, arsenical nickel, cobalt, or autimonial ores.
It is also our purpose, after fully describing the ores, to place before our readers all the different processes employed in extracting the valuable metals, in various parts of the world, carefully and minutely detailed, 'and also, so far as we can arrive at them, all the Specifications of Patents, issued for such parposes in the United States and Europe.

Tue Horn tos Gold and Silver Mining Company, Mariposa county, are sinking three shalts on their rein, and at a depth of 28 feet are taking out decomposed quartz thickly studded with gold; togather with arsenurated Sulphurets, very rich. The Messrs. Goddard \& Co. have nearly completed a mill, for the company, of 20 stamps, with an engine of 50 horsepower

## TABLE MOUNTANN COPPER MINING COMPANY.

A large pile of sacks, containing copper ore, may be seen upon Montgomery Street, in front of No. 528 , which has recently been received from the 'lable Mountain Copper Mining Company's Claim, located some three or four miles to the southward of Copperopolis. The claim was lucated about two years ago, since which time considerabl- work has been done, but with no important rcsults, unlil about three weeks since, when a well defined lead of sulphurets was struck, narrow at the top, but gradually widening out, until it is now about two feet wide, with both walls well defned. Our cor respondent considers this development one of the best outside of the Union claim. This claim, we b. lieve, has gen erally been considered as on the same lead with the Keystone, Union, tte., and the appearance of the ore as seen upon Montgomery street, would seem to indicate that suci, is the fact-the general characteristics being similar and quite distinctly marked.

We understand that work is being prosecuted upon this claim with vigor, night and day shifts being i mployed. This, we believe, is the 5th claim in that locality which is now making regular shipments of ore, viz.: the Union, Keystone, Napoleon, Hughes and Table Mountain. The Calaveras Company has shipped considerable ore the past season, but operations on that mine have been suspended for the present.
Regular shipments will hereafter be made by the Table Mountain Company. That just received consisted of five tons, all taken from the main shaft, which is still going down. A drift is just being started, from which, and the shaft, the workmen will soon be able to take from three to five tons per day-increasing, gradually, from that amount, as the mine is more fully opened. The ore speaks for i'self, and taken in connection with the above facts with regard to the mine, warrants us in pronouncing this one of the most important copper developments in that interesting region. The Company is incorporated, Mr. M. G. Elwore, at 528 Montgomery street, being its Secretary.

## VIRGINTA CITY.

The Editor of the "Spirit of the Times,', in an editorial letter from "Silverland," speaks quite glowingly, yet truthfully, of the growth and prospects of Virginia City. We make the following extracts:-
The city of Virginia is the second city (in all those attributes which go to make up a great commercial and business emporiam) on the Pacific Coast. * * * Firginia has a growth of little over three years, and her record to-day is a history of itself. Her population is nearly double that of Sacramento ; is double that of Portland, Oregon; is four times as great as that of Stockton or Marysville. Taking in the population of Gold Hill, which stands in the same position to Virginia that Mission Dolores does to San Francisco, and we have at least twenty thousand inhabitants, and were the officers who take the census strict in the performance of their duty, I believe the number would be increased rather tban diminished. * *

Last year the taxable property of Virginia was in the neighborhood of $\$ 8,000,000$-this year, the Tax Collecter informs me, it will border close on to $\$ 11,000,000$, nearly double the amount. The assessment on this is $\$ 2,72$ on the $\$ 100$, of which thirty cents goes for school purposes, eighty cents for Territorial purposes, and the balance goes to meet the requirements of the county. This will give some little evidence of the wealth, rapid growth and stability of Virginia. * * * The amonnt of business done in Virginia is positively immense and astonishing; it never ceases and seems to grow by what it feeds on. In extent, value and constancy, it is more like a city of ten times its age and population. It is remarkable in all the phases it presents, and is another high (!) and enduring monument to the energy and enterprise of the American people. The completion of the Central Railroad to this Territory will make Virginia a gigantic inland metropolis, and, independent of that which $I$ have already seen, I believe that in five years from the present writing, by means of its own natural growth, in will be a city of forty or fifty thousand inhabitants.

The New Fork Post contains a list of 26 Banks organized under the National Banking law, wilh an aggregate capital of about $\$ 3,500,000$.

## CALIFORNIA COPPER SMELTING WORKS.

Editor Mining \& Scientific Press-Sir:-In your number of the 21st. inst., you were kind enough to give a notice of the "California Copper Smelting Works." Your remarks are correct in the main, and I take pleasure in giving you the subjoined further details which may be interesting to your readers.
The following are the rates and tarms on which the Company are now purchasing ores:
Ores assaying from 8 to 11 per cent. are purchased at the rate of $\$ 2$ per each per cent.

$$
\begin{array}{ccccccccc}
\text { Ores assaying } & 12 & \text { per cent. } & \text { at } \\
\text { O }
\end{array} \$ 25,00 \text { per ton. }
$$

A. ton is received at $2,3 \% 6 \mathrm{Hb}$, to be delivered at the Company's works at Antioch. Shipments may be made in bags or in bulk. If in bags, they will be returned. The land and water freight will be advanced by the Company, on the delivery of ores at the works, and payment made as soon as a satisfactory assay shall have been obtaincd.

The Califordia Smelting Works propose to bny their ores upon a different scale from that applied by other purchasers in in this city. When ores are shipped East or to Europe, the net assay is taken, but from one to two per ceat. is deducted and upon that produce the advance is made, and not upon the real per cent. as contained in the ore; but the California Smelting Company propose to buy upon the true amount in the ore. To illustrate :-From ore that will assay, say 14 per cent., any other parties here advancing, would deduct one and a quarter per cent. at least, and call it 123/4.
The Company will not confine itself to the purchase of ores low assay. Contracts will be made for all the ores a mine may produce, and the higher the assay, the greater will be the price per cent.; but it is obviously to the advantage of copper miners to sell their inferior ores to the Smelting Works, since they cannot be profitablly shipped to a foreign market; and the expense of concentration and the loss of metal attending on that process, will conterbalance any advantage obtained in economy of transportation, when concentrated.
Additional furnaces will be built, and due eapcity of the works will ba made to keep pace with the supply of ores.

Your ob't. ser't.,
Ralph Eaerson,
Secretary.
Tur Regent Rice "Strike" of the Opair Company.We learn form the Territorial Enterprise, through the Superintendent of the Ophir mine that since the discovery of the rich vein on the surface, back of the incline, some ten days ago, he has sacked and shipped to this city, about 5 tons of choice ore dailg. The largest day's work was 15 tons. The most of the stuff thus far has been valued at $\$ 2,500$ a ton, but some of it went infinitely higher than that; another clasis will pay $\$ 1,500$; and still another $\$ 3,000$. Over 60 tons of it, altogether, have been shipped since the discovery of the vein. The lead was stripped still further yesterday, and herealter the daily yield will be considerably over 5 tons. Within the past few days another vein has been found, some 20 feet further west, the ore from which assays $\$ 405$ per ton.

The Ebb Tide.-The travel from and to the Washoe and adjacent country is becoming equalized. The flow back upon us is steadily mereasing.

The " Clatis" or Reese River.-According to the Reese River Reville of August 1st., there were, at that date, located and recorded in that mining district (Reese river) about 1,300 different company claims. Nearly hall are seperate ledged. Mount Hope has about 75 companies ; Ravenswood, 85; Simpson's Park, 230; Big Creek, 350; Smoky, 300 ; Summit, 100 ; Saute $\mathrm{Fe}, 60$; Grass Valley, 15 ; Union, 20 ; Cortez unsnown.

Australian Gold Mines.-The gold mines of Australia have been gradually declining for the past five or six years. Their average for the past twelve years is set down at \$41,000,000 . These mines have gradually declined from their highest yield of about $\$ 75,000,000$ to a probable present. yield of not far from $\$ 25,000,000$.

Humboldt Mines.-The great riches of this mining distri is well known, and little need be said of it. We have fac in abundance, to substantiate this, from persons of undoubt veracity. Yet there scems to be a strong tendency, amo the mivers and people generally to content themselves wi prospecting and hunting up "big things," instoad of procee ing vigorously with developments. This is an evil that mil
be overcome. The mills are said to be comparatively id be overcome. The mills are said to be comparatively id
owing to this rush for new discoveries. A great lack of $\epsilon$ ergy is apparent. People seem to be acting apon the impry sion that selling a silver mine is a more expeditious mode acquiring wealth than working it, and accordingly the gTI anxiety seems to be to discover and "fix up" new leads the San Francisco capitalists.

There is no question but scores of mines have been open in that region, which will eventually be proven to be vi, rich. As it is, however, the hills and ravines are everywhy dotted with mere prospect holes, with here and there a fi hundred pounds of rock brought to the surface, where, inste the beholder should see large piles of ore at the mouths the tunnels and shafts, all ready for transportation to the mil Irue, much of the ore found in this district caunot be worl by the ordinary silver process, still there is an abundance ${ }^{1}$ ore there, or we are very erroneously informed, which cran worked-amply sufficient to afford the fullest employment the idle mills which have been erected there.
If miners would advance their true intersts, they should : deavor to develope their "feet," rather than to add, ind:nitely, where thousands already exist.

The local papers and correspondents of that region all ags in the above representations of fracts. Let the miners Humboldt delve into their hills with tunnels and shafts: they know how to do-let them bring to the light those; minerals as they can do-let them haul it to their idle mills take out from the ore the gold and silver bricks as they shi do, and, our word for it, they will soon place the frum mines in the front rank of mining localities on the Pa Coast. By so doing they will not only greatly advance th own interests, but add immensely to the productive weald the coast. A hundred feet fairly developed are worth th sands unimproved. A thousand dollars spent in develor a good mine is worth many thousands, scattered over au tire district, with no developments to prove it value.

Muce confusion is often created by the use of the terms r 4 and left banks of the river. Scientific writers use the te in reference to the position of a person descending the ri, This technical sense of the term is now well settled am geogarphical societies and scientific travelers. This has b fond the only way to give it any defnite meaning. Ri turn and wind so that nothing definite can be made or east, west, north and south banks. Travelers go up str and back again so irregularly, that none can know which ) is on their right hand or left at any particular time, ut they tell us, every time they use the word, which way are going.
Subscribe.-Ate you a miner and not a subserifoer to Mining and Scientific Press? If so, you are an an loser of many times the price of a year's subscription, ticularly if you are engarged in quartz mining. The $\varepsilon$ amount of practical information, important to miners rechanics, which is contained in a volume of the Press, not be bought from the shelves of any bookstore in the c
try for the price of several year's subscription. Do you send a paper to the "Old Folks at Home?" If so, ani desire to send important information and valuable re matter, you can find no paper that will be read with so it eagerness by them, or one that will convey to them a an account of the real industry of the country as the ing and Scientific Press. We invite all to send us names and four dollans, or two dollars for six months, become patrons of the only mining paper printed on thi cific coast. Those who receive a paper with this parac marked may understand that it is sent to them for exal tion, and with the hope that it may so far meet with approval as to Warrant their subscribing for it at once. six months ; but inasmuch as we are anxious to intrit the paper where it is not now known, we will, for the ent, send the Press for three months even, on the rece one dollar, in coin or stamps. It is our belief that no will wish to discontue the paper after being a constant yi or of it for even that short period.

| We appond the following list of companies, |

## THEE MINERS' T.ABORATORY.-NO. XII.

minerafogy of biluter.
Silver is found in a variety of forms and combinations. Our object, in the present chapter, will be to describe them.
Silver is found native, ( $i$, e) nature supplies as with the metal in a metallic state. occasionally. It fuses bebert the blowpipe ; is solutle in nitric acid. The addition of hydrocloric acid, or common salt, produces a copious, white, curdy precipitate, which turns black on exposure to the light.
Some varieties contain very small guantities of copper, antimony, and arseuic; others contain gold. The specific gravity of pure silver is 10.1 to 11 .
Silver occurs in veins, rarely in beds; in crystalline slaterocks, gueiss, mica slate, hornblende slate, granite, syenite, porphyry, with arsenic and various ores of silver." It is met with mosr abundantly in Pera, Mexico, and Chile, and we may now add also Nevada Territory and California.
An amalgam of silver, with the following composition, has also been found in several places:-

$$
\begin{array}{llll} 
& & \\
\text { Silver, } & 25.00 & 27.50 & 36.00 \\
\text { Mercury, } & 73.30 & 72.50 & 64.00
\end{array}
$$

Silver also decurs in combination with Tellurium. Other metals are also present, as will be secn by the analysis given below. The scientific name of this wineral is syloanite. Specific egravity from 7.99 to 8.33 ; lustre, metallic; steel gray, tin white, silver white, some times inclining to brass yellow, streak the same.- When heated before the blowpipe on charcoal it imparts a greenish-blue color to the flame, deposits a white sullimate on the charcoal, and melts into a dark gray bead. If heated with soda it yields a globule of an alloy of gold and silver; disolve in nitric acid, with the exception of the gold, if silver be in sufficient excess ; yielding a white precipitate with hydrochloric acid.

| analysis. |  |  |  |
| :---: | :---: | :---: | :---: |
| Gold, | 30.00 | 26.97 | 26.47 |
| Silper, | 10.00 | 11.47 | 11.31 |
| Lead, |  | 0.25 | 2.75 |
| Copper, |  | 0.76 |  |
| Thillimine | 60.00 | 59.97 | 58.81 |
| Antimony, |  | 0.58 | 0.66 |

Peterite, Lastre Metallic. Between leadgray and steelgray; streak the same ; slightly malleaide; specific qravity 8.31 to 8.83 . When heated before the blowpipe on charcoal, it volatilies, leaving a britte globule of silver, soluble in hot nitric acid; after standing some time the solution deposits crystals of tellurie of oxide of silver.

Occurs in granular masses, with iron and copper pyrites and blende in tale slate in two or three mines ouly.
Antimonial Silver. Lustre metallic silver white, inclining to tin white, streak the sume, sectile, specitic gravity, 9.4 to 9.8 ; melts easily when heated before the blowpipe, emits fumes, and deposits a sublimate of oxide of antimony on the charcoal, leaving a malleable globule of silver, partially soluble in nitric acid, leaving a residue of oxide of antimony undissolved.

Occurs in veins in granite, phorphyry, and crystalline slate rocks accompanied by silver, arsenic, arsenical pyrites, galena. Ruby Sllver-Seleriurel of Silver and Copper. Criptalline, lustre metallic, lead-grey, streak shining,soft.- When heated before the blowpipe, emits the smell of Selenium, or a smell resembling horse-radish.

This ore was found in cleavable grains in a copper mine, now fursaken.
Other rarieties of Seleniurets containing silver, are met with, but they are not of much importance, and we shall not describe them.
Gullencu, that is sulplide of lead, contains silver as sulphide, amounting usually to .01 and .03 per cent. occasionally to .05 and rarely to 1 per ceat.
Su'phurets of Silver: Lustre metallic, blackish lead-grey, streak shining, malleabie, specific gravity 2.96. Before the blowpipe on clarcoal intumesces, melts with disengagement of a gas, called sulphurous acid, giving off the odour of burning salphur, and at last yields a globule of silver, soluble with the exception of sulphur in concentrated nitric acid.

$$
\begin{array}{llll}
\text { Silver, } & 86.50 & 86.39 \\
\text { Sulphur, } & & 13.50 & 13.61 \\
\hline
\end{array}
$$

Stromeys/e.-Sulphuret of silcer and copper, lustro metallic, blackish lead gray, streak the same, shining, perfectly rectile, specific gravity 6.25
Before the blowpipe it fuses readily into a gray metallie globule, which with fluxes affords the reaction of copper, and by cupellation, yields a globule o! silver. Partially soluble in nitric acid, learing sulphur undissolved

| Copper, | 30.48 | 30.95 | 53.38 | 53.94 | 60.58 | 63.98 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Silver, | 52.27 | 52.71 | 28.79 | 24.04 | 16.58 | 12.08 |
| Iron, | 0.33 | 0.24 | $\underline{15}$ | 2.09 | 2.31 | 2.53 |
| Sulphur, | 15.78 | 15.92 | 17.83 | 19.93 | 20.53 | 21.41 |

Form in crytals, usually massive and disseminated.
Copper Glance or Virreous Copper, such as is obtained in Plumas County, California; and Colorado. We have also seen samples of the same kind of ore from Washoe, containing variable proportions of silver from a trace to 1 per cent. Samples of this kind of ore from Chile have assayed as high as 2.96 per cent. in silver.
To detect the presence of silver in such ores, proceed as follow: Dissolve the finely pulverized sample in pure nitric acid. Evaporate the largest portion of the acid by continual boiling, dilute with water, filter, and to the filtrate add hydrocloric acid, and a white precipitate will indicate the presence of silver in the rock.
Jamesonite; lustre metallic, steel.gray, streak the same, sectile, specific gravity 5.564 to 5.616
Decrepitates when heated. Bufore the blowpipe it melts easily, deposits a suplimate of oxides of lead and antimony on the charcoal, and after, lead and antimony are driven off, Ieaves a slay which usually affurds the reactions of copper and iron.

| Lead, | 39.67 |
| :---: | :---: |
| Iron, | 2.93 |
| Copper | 1.73 |
| Zinc, | 0.34 |
| Silver | 1.44 |
| Bismuth, | 0.21 |
| Autivony | 32.17 |
| Sulphur, | 18.07 |

Mr. Editor :-The remarks of "A Poor Chemist" on my communication to your journal of the 3 d . inst., on $t \cdot e$ tests for silver, are anything but what one would expect from a genlleman professing to be acquainted with chemical reactions: The errors that crept into my communication by inadvertance, owing to the fact that your proof reader was not well versed in chemical tests, were sufficieutly evident to the merest tyro in chemistry. Allow me to inform "A Poo Chemist" that I am thoroughly acquainted with the test fur chlurine. I deny, though, the assertion of "A poor Chemist" that Sulphide of Ammouium and Chromate of Potash are not commonly used as reagents to prove the presence of silver. Can he point out to me any author on practical chemistry who has neglected these tests? Would he consider an arti cle on tests for silver complete without the above tests? especially when we take into consideration that it is your object to lay before the readers of your valuable jourval, from time to time, a list of tests for all the metalls.

A Poor Chemist" also says that some statements, however, of the properties of Hydroctoric acid seem to imply absence elsewhere." I shall feel thankful to "A Poor Chemist" for pointing out to me and your readers, where I have erred in deseribing the propertios of Hydrochloric acid when aty-

## dRy CRUSHING.

It is anw a generally conceded fact that by the wet method of crushing quartz a large proportion of the gold is carried off from the batteries and away from the mill in the first rush of the water, employed to discharge the sunds thro' the sieves. Gold is capable of such minute divisions, and is so easily separated that all must concede that in the violent abrasion to which it is subjected in the battery, its particles, as they occur in the quartz, must necessarily loose much of their weight hy parting with numerous atoms so infinetissimally small, that the slightest cnirent of water must inevitably carry them off.
We will illastrate, again, as we have, already doue in a previous number:-A piece of gold, especially if it be pure, drawn across, eren so soft a substance as a piece of bone, leaves a weil defined yellow mark 'This mark, of course, is made of particles o! gold which have been abraded by the contact of the two substances "It is often the case that gold is found thro igh the entire mass of rock, in pallticles 10 larger than thuse which form this graphitic-like mark. Such, no doubt, is the character of the gold found at the Mission near this city. A moments reflection, with this little experiment iu miud, can scarcely fail to astonish any quartz miner, who has never had his attention particularly called to the matter before, at the large pereentage of loss which must occur in a battery where many thousands of particles of intermingled gold are, for hour sand days, subjected to the temible abrasion of eight hundred pound stamps contipually falling upon a mass of angular fragments of hard qu rtz. Of course, a large percentage of the gold mingled with quartz, must be reduced to particles quite as minute as those contained in the supposed yellow mark upou the bone above alluded to, all of which must inevitably be carried off by the water necessarily passing through the battery during the process of wet crushing. Indeed, this finely divided gold will foat upon the surface of the water for a month, even when it is slightly agitated, without beconing wet on its upper surfaces, aud, of course, without sinking.
Another great loss from wet crushing arises from the fact that no seives cun be made arailable with holes sufficiently Gine to retain the quartz in the battery untilit is reduced to a proper fineness for liberating all the gold which it contains. Huadreds of distiuct particies of gold may be contained in a piece of quartz no larger than a pin's head, a large portion of which might be separated and saved by proper machinery, but never by any machinery where wet crushing is employed.
The facts above stated have, for years, been gradually impressing themselves upon our quartz operators, until the losses, sustained by the processes at present in use have come to be looked upon as a matter for the most serious investigation. Dry crushing, in the first ins auce, is the only cenceivable remedy, for the losses alluded to. Of the various processes for amalganatiog, there are several in use which might be advantageously employed. Of these we may speak, at length, in a future issue. The matter at pres-, eut under review is crushing-wet and dry.
As alreally intimated the evidences of the losses from wet crushing, have long ciallenged the attention of quartz men and various expedieuts have been resorted to to render practical some process of dry crushing. The ordiuary straight and round batteries have been tried with sieves boxed up to prevent the dust from rising. A very ingenious machine for dry crushing, was iutroduced to notice, in this city, lavt winter, and illustrated in this journal, Lunwn as "Pond's Crusher." We have also given an extended notice of Howell's Centrifugal Crusher, which has been quite thoroughly tested at the Pike's Peak Mines, but the latest improrement in the way of dry crusbing, is a machine recently got up and patented, by Messrs. Wheeler \& Hotalling, and which may now be seen in operation at the Mivers' Foundry in this city.
This latter machine is the one alluded to in our last issue, which we will now atteurpt to describe as well as it may be done without illustrations:-
This machine, in the first place, comprises an ordinary battery-without sieves; boxed up closely. In the rear of the battery, and some some six feet distaut, is a large chamber some ten feet square. Two or more tales or pipes start froin the upper, interior space, within the battery, and unite
(f)w the nutside, as inear us may lie to the same, and extent ' fitu the lower portion of the chanber atoresnid. Abrut filway of this tubue, is is omall ctamber in which is placed In exhanst fan, which, when in opration produces a strung Thaust curcent of air from the int?rior of the buttery to hie interior of the chamber. As a matter of course the harta, as liat as it is thoroughly pulverized, rises, in the frm of dust, is drawa through the tuke and deposited in the hander in the rear. The fineness of the dust is regulated putirely by the furce of the exhaust draft, which may be asilg reguluted hy a sliding tubeor the speed of the fan. his current is kept up and aicied by a return flue, of much arger limensions, from the top of the chamber to the luwer fortivu of the buttery-the return flue taking the air from a hint in the chamber, as far rentuved as pussible from tho int whore the dust is received from the battery. Actual orking shows that very little is roturned to the battery by wh curn current of air.
This machme is but an experiment, yet a most flattering he thus fur. We are not yet able to determine the quantiof work which it will perfurm. Of course the wear and ar can be no more than that of an ordinary battery. Our pression, from what we have seen, is that the buttery now use-fuur stamps of 500 tbs . each-can reduce about - tons of rock, delivered to the battery dry, in twelve urs. The rock delivered from the machine is redured to hine dost, exhibiting but a mere grit, whell tried between fe fiugers, dry. We have, at unr office, a sample of the st which we took up at the mill, frow a large mass, as a r sample of the whole.
Impurtunt improvementsare already in contemplation. eexperiment is in the hands of parties who have had Fo experinuce in quartz mining, and who will spare no furts in bringing it to perfection. Quartz miners and otha interested will do well to examine and judge for themves. The machinery has been at work upon rock from quartz mives back of the Mission in this city.

## THE MINING SHARE MARKET.

The Mining Share Market has presented nothing of ecial interest during the past week. It has en claracterized by rather more than a fair degree of fivity and with about the usual fluctuations. The transacno may be set-down as large, though generally at reduced. Lus. Advanced rutes, however, are noted in several shares. could \& Curry, early in the week, declined $\$ 250$ or time, t subsequently adranced a shade, closing firm at $\$ 4,725$, $u$ reason, so far as we have been able to learn, has been asned for the recent decline in this stock. The yield of the he continues without abatement, and larger dividends are il confidently expected after the present month, or as soon the additional works now in progress bave been compled. The late sales have been made by parties who have retufore refused the highest offers.
Ophir shares opened at $\$ 2,450$, advanced $\$ 75$ on time, but 4sed at $\$ 2,350$, with sellers at 2400 . The recent "rich fike" in this mine is still reported as continuous, with no pearance of "giving" uut"-anything but the richest kind of valued at from $\$ 1,000$ to $\$ 3,000$ per ton. If there is any proximation to truth in the reported richness of this rock, is difficult to conceive why the Company should not inpase their dividends, at an early day, to a higher figure than y which it has yet reached,
Potosi shares are held firmly at an advance of $\$ 100$. We ute at $\$ 825$. It is said that a fitice contest will be made the Grass Valley Company for a title to this valuable ne, and that every preparation has been made by them to reggthen their application for an injunction against the tos $i$. The argument is to be heard by Judge Mott during present week.
Grass Valley stock, under the influence of the above proledings, is in request at about $\$ 95$.
Chollar shares, which had adranced, the previous week 1 m \$1,150@1) 1,500 , have not been so much sought after, past week, and have declined to $\$ 1,300$. The affairs of ts Company, at the present time, are under a most prusrous condition, such as can scarcely fail to advance its Pres, at an ourly day, begond any figure w bich they have y reached. It is statod that sixty tons of ore are now y reached. It is statod thart sisty tons of ore are now
lly taken out of tho north end of the mine, which is sold
at an nverage of $\$ 3 n$ pel ton. The companys new 100 hosee porwer engine for huiktinw, pumpung. मte., will he used 4(1) fieet south of the present workinges; the shaft at this point has penetrated to he depth of 285 feet.
Hale \& Noreross bas nut been in the market the past week. Its stuck is held by parties who are nut ansious to part with it, at presint uffers.
Centrul and Califurnias shares have not been much dealt
White \& Murphy, Dick Sides and Best \& Belcher, are withheld at present. "No transactiome" are reportesl in these shares. Judge Mott has granted an injume ion urainst the the Kohinoor Company, at the instance of the Bost \& Belcher.
Spanish No. 2, adjoining the Mexican and Ophir on the Nurth-East. According to the Prices Current of the 13 th inst., this mine "is attructing some attention." After two years of patient lahor and the expenditure of a large amount. of money by this company, it is said that a continuation of the "white lead" of the Ophir and Mexican has been developed, and that abundaut pay metal is now in sight. This stock has been dealt in, the past week, at great fluctuations, opening at $\$ 75$, and closing at $\$ 35$.
Buckeye has been quite active, in fact has been the fancy of the week. Sales of 553 shares are reported at $\$ 38$ @ $\$ 62 \frac{1}{2}$. It opened the week at $\$ 55$, advanced to $\$ 60$, at which figare some large sales were made. Buyers were induced to invest upon the report of a favorable financial condition of the company, with cash in hand, a large amount of pay ore on the surface and a new vein "just opened," containiug "black sulphurets, very rich." The speculators baving accomplished their purpose, the shares fell back to their old standard and closed the week at $\$ 38$.
The Sacramento and Meredith Companies having consolidated their interests, will hereafter be kuutvn as the "Sacramento \& Meredith Mining Co." The latest quotations of these shares are $\$ 115$ for the former, and $\$ 70$ for the latter No sales of the consolidated stock have been reported.
Overman is still growing in favor. Its shares have been considerably dealt in during the week, fluctuating from $\$ 380$ to $\$ 500$, closing at $\$ 390$.
Wide West has been largely dealt in, at declining rates These shares opened the week at $\$ 165$ and gradually fell to $\$ 145$ (a) \$147 at the clase-sellers \$150.
Real del Monte shares have attructed marked attention. Closing the previous week at $\$ 275$, they opened the past at $\$ 300$, advanced to $\$ 435$ and closed at $\$ 415$. Sales of 130 shares are reported.
Esmeralda is dull at $\$ 22$, Silver Hill at $\$ 30$ @ 33, Ural firm at \$150.
Coso has declined to $\$ 11$, Josephine advanced to $\$ 131 / 2$, and Willow Springs is quoted at $\$ \pm 3 / 4$.
Sheloa shares have changed liands to a limited extent extent at from $\$ 222 @ \$ 225$. De Soto had advanced to $\$ 70$, after having sold for $\$ 48$.

COPPER.
We have no report of transactions in copper stocks for the past week. Intelligence from the mines, however, is still of the most gratifyiug nature. Almost daily reports are reaching us in the shape of large quantities of well filled sacks of the most promising ore.
The Table Mountain Copper Co., near Copperopolis, has made its first report of this description, which may be seen seen in front of the Secretary's office, on Montgomery street and which is elsewhere alluded to more at length.
The Union, Keystone and Napoleon still continue their regular shipments. Small shipments are also beginning to to come in from several new sections of the copper belt, which are received as the earmest of larger ones soon to follow.
Considerable attention is being attracted to the copper mines upon the Colorado. Some very superior ore has recently been received from that section.

Pick Manofactory.-We would call the attention of miners to lie advertisement of Mr. Hiram Wiite, which will be found in our columns to-day, who has recently established himself, on Bush street in this city, for the manufacture of Picka for miners use. Mr. Wright makes a very superior article and miners or others eugaged in the trade will do well to call upon him.

## SUGGESTIIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general ule, sny invention which is valuable to the patentee in this country, is worth equally as much in England avd some other foreign countries. Four patents-American, Euglish, French and Belgian-will secure an inventor exclusipe monoply to bis discovery among one bundred millions of the most intelligent people in the world.
The facilities of business and steam communication are sucb, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the Mining and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Government, we obtain parents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptuess and dispatch.
Models are not required in avy European country, but the utmost care and exper ieuce is necessary in the preparation of the specifications and drawingse
When parties intend to take ont foreign patents, engravings should not be published until the foreign applications have been made.
Cautrox.-It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at bome.

While it is true of Most European countries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should bave their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination ; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patentagents or patent brokers, as they caonot ordinarily be trusted with valuable inventions.

miucral regions of California, Nivada and Nexico, and miucral rrginas of Califnonia, Nurada and Mexica, and
have established a clam to nublic confi.lenco, vever get have established a clam to nublic confi.lenco
equalled in uby piece of minhing machinery.
Thesc mills are constructed almost entirely of Iron, and, conseriunutly, arr not aftectel by the intenae heat and dryness of a mophere, cotomon to all minitg local-
tied. They are adipted tis tied. They are ndapted to

## BOTH WET AND DRY CRUSHING,

and are warranted to reduce, with the same weight of Stamps, 25 per cent, more rock than any othor mill in
use. Fach Batery is complete in tself, and forms a use. Each Battery is complete in Pself, and forms a
perfect mill-while any number of them can bo added at a subseqent time-thus prescring the symetry and uniformity of tho Mill

As an evidence of the incrensing favor with which
those mills nre regarded, we would menting that the those mills nre regarded, we would mentinu that the
Celebrated Ophir Company first intreduced them ine Celebrated Ophir Company first intreduced them int
their works in 1880 , and have been ndding a number of their warks in 1880, and have been ndding a number or
Batteriea, each subsequent year, until they now have Nineteen, runaing Seventy-nix Stamps,
They are perfectly fitter and set upat our Works, beore shipping, each piece being marked and numbered Bo that they can be put up and set at work in ten hours after arriving on the grounn. They are mane of two si-
zes, four and five Stampis each. The Four Stamp
Batiery weighing complete abnut 8.000 pounds, zes, four and five stamps each. The Four Stamp
Batiery weighng complicte about 8,000 bouds,
and the Fivo Stamnabnu1 7.000. The Mortar Bed ueing cast in sections, when desircd, so that the mills can be packed over any mountalu road.

We annex the names of a few woll known Companie,
who have adonted them-rmning from fur to seventy Wive staraps each-to whom refereuce is made:

VOL. VI. SAN FRANCISCO, NONDAY EVENING, 1 LGUST 24. 1863. NO. 43.

## REMOVAL.

The Ofice of the Mining and Scifatific Press, hav been moved to Rooms Nos. 56 and 57 Guvernment House, corer of Whalingtun and Sansome Streets. We have been flaced to make this change of location, not ouly with the Pew of securing in re roon and better accommodations for arselves, but chiefly to better accommodate persuns having dsiness with the office. Our lucation is now central, easy ancess, and in the direct way of the chief travel of the ty to and from the Post Office.

## Our Proposed Enlargement.

The rapid increase of husiness hoth in the enlargement of ir circulation, and in additions to our advertising patronfels such as we hope will soon enable us to announce a prmanent enlargement of the paper. For the piesent we opose to issue an extra sheet every other week. We shall batinue this arrangement until our business, which we bat will continue to improve, will warrant a permanent enrgement, when the two issues will be thrown into one eeet and the paper established as a sixteen page issue.

## Our Mining Register

The,supplementary issue of the present week, will const mainly of a revised edition of our Mining Register hich will be delivered free to all subseribers. Eatha cop$s$ will be furnished to subscribers at the regular subscripon price-Non-suhscribers will be taxed tweaty-five cents. will be issued to-morrow-Tuesday.

Copprbopolis. - We continue, in our present issue, the pubsation of notes taken during a late trip to Copperoplis, his region is being rapidly developed by the energy of its uers, aided largoly by San Francisco capital. We spent veral days in Copperopolis, but not half time enough to come thoroughly acquainted with its value and extent as mining region. We shatl endeavor to place before our aders such facts as we were able to collect, promising ourIf another visit at an carly day, for more extended obsertion. We also hope at that time, to extend our trip inAmador, and still other portions of Calaveras county. In ir next issue we shall speak at length of the Keystone, hion and Calaveras Companies Mines, and also of the Naleon. We enjoyed our trip thither, much, and would take is opportunity to tender thanks for favors and courtesies ceived-especially to the Messrs. Powning, to Mr. J. W. $3 a n$, the gentlemanly clerk of the Copperopolis Hotel, and Mr. W. T. S. Ryer.

Ratlroad in Nevada Territory,-The Virginia Cityand uckee Railroad Company has been fully organized and a rvey of the road completed, and gradiog is to commence mediately. The road runs from Virginia to Washoe City, distance of thirty miles. A branch of four miles debouches d touches Carson City. Ti e estimated cost of equipping d construction, is $\$ 2,583,06956$.

The Pennsylvania Coal Mines Considered in Connection with the Recent North rilnvasion of Gen. Lee.
There is little doubt bot that the destruction of the Pennsylvania Coal Mines was a portion of the rebel programme as blarked out by them on the recent invasion of Lee. Had the confederate forces succeeded in occupying Harrisburg, the railroad communications between that point and the mines, about 50 miles distant, would have been destroyed, also all the pumping, hoisting and other machinery necessary for working them. It is not at all improbable that he would also have set the mines on fire, as he night easily have done, thus literally kindling a flame in the heart of Pennsylrania, which could never have been quenched except by turning rivers of water upon the conflagration!

The damage not only to the great industrial, but also to the commercial and military interests of the country which would have resulted from such proceedings can scarcely be estimated. All other raids which have been consummated by either or both beligerants, would, in their aggregate even, have fallen short of the tremendous blow which the destruction of the Pennsylvania Coal Mines, would have inflicted on the North. Northern industry would have been completely paralyzed by this single blow.

Anthracite coal is found in large quantities in no other part of the world but Pennsylvania. Enormous quantities of this description of coal are used for making steam in the countless workshops and manufactories of the North, and on their river and ocean steamers; while the Federal navy, as at present organized, would be almost powerless withoutit. The bituminous coals which are found in other localities, are farinferior to the anthracites for making steam, while the cost of transportation of such coals to the Atlantic coast would be enormous. The Richmond Whig of July 2nd was quite jubilant over the prospect which then existed that this terrible blow would fall upon us. It was hapily averted by the terrible battles of July 1st, 2nd and 3d, and the government has evidently become aware of the great strategic importance of Harrisburg, and energetic measures are in progress for securing its safety against any future contingency.
Improved Water Pipes.-Wrought-iron water-pipes, lined and coated with hydraulic cement mortar, which are great improvements on other substitutes for cast-iron pipes, are now, at the East, rapidly superseding the former exclusive use of iron, under conditious of expense, oxidation, tuberculation, and leakage, which involve serious objections in water-works practice. These pipes have spigot-joints, can be back-filled as soon as laid, and tapped in the same manner as cast-iron pipes. Cement lined and coated water-pipes are now in use in a large number of our northern cities and villages, and have proved very satisfacto'y in operation.

State Agricultural Soctety.-The Tenth Annual Fair of the State Agricultural Society will commence on the 25th of September. Ten thousand dollars have been appropriated

Mr. Hidiur :-You will beur me witness that it was only at the last moment before your going to press a fortnight ago that I penned the few lines which appeared in your mimber of that date. Thesy were inte ded to prevent any of vour readers from purchasing sulphate of ammonia or chlorate of potash instead of sulphide of ammonium and chromate of potash, which those of them who relied only on "P's" commuaication would have been likely to do. With the errors that he says "crept in by inadverterce," left uncorrected and therefore by implication coufirmed, "miners," not "yros in chemistry", might otherwise have wasted their money and their time. " $P$ ' $s$ " rejoinder in your paper of lats week gives much more importance to the subject. I found the letter in "Tue Miners' Laboratory." "P" now classeb it with the works of "authors on practical chemistry." Does he really wish to imply that he considers his "list of rengents for silver complete?" It, contains but six. Rosé enumerates 19. I think, therefore, that I had a right to assume that the six were selected for their aptitude for occesional use, away from the resources of a fixed laboratory. I apoke of two of them as not commonly used. What is the fact ? Alo a, they do not furnish distnctive tests, when employed with solutions which may contain other metals than silver. The chromate of potash is classed by the above well known authority among the least used reagents. Can "P." buy one pound of the pure salt in San Francisco, in a day? The sulphide of ammonium is one of the most perishable articles we use. The air contained in a half filled bottle will destroy its purity. Fownes, Lamborn and Muspratt omit one or both. I have referred to books in my reply to the enquiries of "P," but I will venture to say that "P" in his practice, when traveling or prospecting, would never encumber himself with so superfluous an article. Why does "P" sneer at me in reference to chlorine? I wrote chloride. Need I tell him that I meant chloride of potassium, or chloride of calcium, which occur according to the mode employ: ed in the manufactiue of the chlorate of potash.
"P" might have been "absent," I thought, but he has returned to his task, and he is still of opinion, he says, that "a solution of hyd,ochloric arid" added to the "contents of a bottle," will "precipitnte (silver.) antimony and bismuth." His first letter stated the color of the precipitate, viz: "wohite." I cannot doubt therefore that he has seen it. Allow we to congratulate him on his discovery; but why did he not amnounceit as such? He added that "a qua.ter of an ounce of hydrochlorit acid" (I suppose the ordinary solution in water) would dissolve the antimony and bismuth, in a few moments. Your readers are therefore in this dilemma, either hydrochloric acid will both dissolve and precipitate these substances, or "P" has omitted to state the important ingredient in his "solution of hydrochlorir ncid," which precipitates antimony and bismuth and makes them rapidy dissolve again. "P" opened with supposing that "the solution" of pure silver was made in nitric acid. He directs no change to be made in this solvent. It will be a farther addition to science, if he will state explicitly how he can dissolve antimony in that acid. It will enlighten many

A Pgor Chemist.

## COPPEROPOLIS AND ITS MINEA.

In our last issue we gare some account of the early discoveries of copper in Copperopolis and its ricinity. A short time after regular work was commenced upon the mine, (early in the Fall of 1860,) Mr. Reed, one of the discoverers, being satisfied that the same would be permauent, put up a cloth house under the big onk tree still standiag in front of the Copperopolis Hotel. This was the first house of any kind, built in Copperopolis. It was used as a boarding house for the hands employed upon the Keystone mine. The- next house built was a small wooden building, still standing on its original location, a few feet distant from the first, and now used as the Justice Court Room. This was also built by Mr Reed, and used as a boarding house for the hands empluyed upon the Union mine. Other structures, of wood and cloth, soon began to grow up around these pioneer building.
Early the following Spring, (1861,) Mr. J. M. Bean, fully satisfied from the derelupements alrealy made that a town of considemble size must speedily grow up in that locality, commenced the erection of what is now known as the Copperopolis Hutel, one of the largest structures in that regiou of country. The commencement of this edifice led to quite and excitement, and a general staking out of lots, was immediately commenced. From that time to the present, Copperopolis has been rapidly increasing in growth and importance, until it now numbers a pupulatiou of fully 1200 souls, with three hotels and several restaurants, two livery stables, two barber shops, six or eight well filled stures besides nuwerous smaller estallishments, where "creature comforts," etc., are dealt out. A school house has been erected and a lot of ground set aside for a cemetary. Religious worship is held in a public hall.

Copperopolis presents at the present time, all the peculiar characteristics of one of the early miwing camps of 18.50 , with the exception that its houses are constructed of lumber rather than canvas, as in those days. We know of no mountain town which bids fair to enjoy a more prosperous or permanent future then this young city of copper. It possesses mines of undeveloped extent, and of the most undoubted richness and permanency. Its future increase must reasonaably keep pace with the developement of its mines, which, thus far present indications excelled nowhere else in California.

## tee mines of copperopolis and ricinty.

The traveler in approaching the foot hills from Stockton, on the Copperopolis road, if at all observant, will notice soon after leaving the plain a most marked change in the character of the country, which is not observable at any point north, along this range of hills, for at least a distance of one hundred miles. The change here alluded to is one, chiefly of a plutonic character, although the sedimentary rocks have at intervals been disturbed by protruding masses of the older chrystaline formations, the latter also much changed by beat. This belt of country is from four to five miles wide, from east to west. Its linear extent, north and south, we had no time or opportunity to observe, but from reports of persons familiar with the country, we infer it to be three or four times its width, at least. We apprehend that but few continuous veins of minerals will found be in this belt. The veins, whereever found, will doubtless be rich, in chimneys; or if continnous will be subject to numerous faulls, or dislocations, which will entail much expense, in working, to keep the course of the vein.

Af er leaving this belt, in traveling eastward, the observer will notice quite as marked a change as on entering it. Its eastern limit is clearly marked by a well detined belt of slate "tilted" as the commonly received opinion is, into an almost perpendicular position, with its slarp, rough edges sticking out of the ground from a mere perceptible uutcrop to sereral feet in height. We have very lititle faith in this "tilting process, in most instances, and in this, in particular; but of that at some future time. How far eastward this belt extends, we know not, for we explored no further in that direction than the town of Copperopolis. Along the linear extent of this slate belt, conforming in dip and direction with it, is what is evidently the mother vein of the district, and upon which are located, commencing at the northern extremity, the Consolidated, the Keystone, the Union, the Empire, and the Calaveras, which are adjoining claims, and through each of which there are unnistakable evidences of a continuous rein.

The character of the euclosing rock, and the surroundins
conntry generally is such as would lead the miner to look there for a continuous rein, without faults, and of a generally superior character. There are no indications of any local disturbances which might be supposed to proance "faults" or any special or eatensive inequalites in the yield of the eins.
This vein may be looked upon as the "Comstock" of the copper region. There are numerous ott:er veins, outside of this, some of which have already been found valuable, and others, yet undeveloped, show most flattering indications. Among these latter we might mention prominently the Eureka and Elizabeth, Oousolidated, situated on the Eastern slope of Bear moutain. This vein, located about three miles to the east of Copperopolis, slows most unmistakable indications of richness. The Company have sunk a shaft of fifty feet, from which they are now taking out ore. This veiu was originally takeu up for silver. It assayed from $\$ 4$ (c) native silver were taken from ravines crossing this rein some five or six years ago. The ore is a sulphuret of copper, with the usual show of carbonates on the surtace. The Company, which is composed mainly of San Francisco men, intend pushing on the work of development with the utmost rigur. The mine is under the superiutendency of Mr. Solomon Julnson. Among the extentions of this lead we notice particularly the Crockett. This Company has taken out some 20 tons of ore--fine yellow sulphurets.
The Table Mountain Company, is generally supposed to be a continuation of this lead, although many think it upon the Union and Keystone lead. Its position would seem to indicate the correctness of the first conclusion, but its general characteristics resemble more those of the Keystone than the Eureka.
Swinging around to the southward and eastward, about four miles from Copperopolis, we came to the Webster and Scorpion Company's claims, continuations most likely of the Union. The former has already shipped some fifty tons of ores to the smelting works of Antioch. They have sunk a shaft 130 feet deep on a well defined lode, six feet wide all the way down. The ore near the bottom of the shaft avtrages about seven or eight per cent., but is now improving with the decent. The Scorpion Company's claim is an extention and has also a very fine lode, yielding a higher grade of ore at corresponding depihe. Considerable prospecting has been done upon this clainn, but no large amount of ore has yet been raised from the mine.
To the south of Copperopolis, some four miles distant is the Swansey and Massachusetts Company's clairns. The former has a. shaft on their lode 70 feet deep, developing ore similar to the Webster and Scorpion. At that depth the shaft leares the lode and has gone down thirty feet further, from the bottom of which the workmen are now drifting to the lead, with the expectation of finding richer ore than at any point opened above. The Massachusetts is a new claim and an extension, presenting flattering prospects. The surface indications are better, if anything, than even the Swansey.
To the west of Copperopolis, and in a valley lying parallel with that in which the town is located, there are a number of mines opened, with flattering indications. At the time of our visit, no work was being done upon any except the the Harlem and the Powning. upon the former, a large amount of work had been done under the direction of Mr. Westby the discoverer and Superintendent. Mr. W. showed us one of the finest shafts which we have ever seen in any locality, which had been commenced, but abanãoned for the time. It is contemplated to put this shaft down, at some future time, to strike the vein at a great depth. At present be is taking out rock from near the surface, from another shaft. The ore from this mine is of a very promising character, considering the depth which has been reached. It reseubles the Napoleon ore more nearly than any other which we noticed in that locality. Passing on, up the valley, we stopped for a few moments at the Kentucky company's shaft, near which we found some very good ore. A short distance from this point is located the Powning claim, a new location presonting very rich croppings. At the time of our visit the workmen had found no very distinct vein, but had arrived at indications which gave promise of soon arriving at a good lend. There are quite a number of other leads in this locality from which we shall probably hear favorable accounts ere long.

Some two or three miles above this locality a new town has been laid out, uader the somewhat high sounding title of Carmen Cify. At the present time it consits of sume three or four houses, only, but from the appearance of numerous specinens of copper ore which were shown us as having been taken from the mines of that neighborhood, we should not be surprised to see quite a town there in another year. The' miners of Carmen City will have to go to work and do something to develope their mines, however, before they will be uble to attract much capital thither. Copper indications have become quite to common at the present time to attract much attention from moneyed men, until some reasonable amount of labor has been done towards their development. It is not every vein that produces a few specimens that will turo out a good mine. Mines must be proved to have certain specific indications before they can be called mines or possess a value in "feet." Miners of every class will do well to bear this fact in mind and act accordingly.

## PROGRESS OF THE PACIFIC RAILROAD.

Steadily and surely onward is progressing the work of thi, great traus-mountane railroad, which as the Western divi sion of the contiucutal roul, is destined, ere long, to unit the Atlantic and Pacific coasts, with indisoluble bands o iron, cemented by a common interest and a united dostimy The first division of 50 miles from Sacramento is alrealy ur:' der contract, and the second division of the same exten which reaches to within six miles of the summit, will also b under contract by the first of December next. The rout decided on is via Auburn, Illinoistown, Duteh Flat and Her. ness Pass.
Work has already been commenced and is going bravel on. Slowly but steadily and surely, the iroa feet are trampin, up the Western Slope, and ere another twelve months shal. elapse the locomotive's whistle will echo along its lower hil and valleys. Three years can scarcely come and go cre th, iron horse will mount its heighest level, pause a time, upo' its giddy height, then resume its onward course across th hills of Silverland, along the valleys of the Great Basin, ar bounding over the slight obstructions of the once dread Rocky Mountains, continne its career far over the distal Plains beyond, and down the magnificent valley of the Platt until it reaches the turbid waters of the Missouri, where, u less the cnergies of our people are greatly overrated, it ir arrive in season to celebrate the return of our next nation decade.
Six miles of the first section of the Western terminus the road are now ready for the rails, and six miles more $W$ be ready during the present month. Six thousand tons of ir have been purchased, the delivery of which will ${ }^{\text {soon }}$ cot mence at the rate of 500 tons per month. A large portic of this amount is now on its way from the East. Six loc motives, six passenger cars, twenty-five freight cars and ti bagage cars are now on their way hither, as also are the tur tables for the first fifty miles of the road.

Yreld of Lakr Superior Mines.-The Houghton M. ing Gnzetle, of July 4th, gives the following as the yield three principal Copper Mines of Lake Superior for the mon of May last:-
The Quincy is again entitled to the flag for the largest pri: The following are the figures :-

The above mines have been fairly opened, and under en getic progress for about eighteen years. Califormia will p sent three, certainly, and we think we could name five if , six copper mines, which will make a better exhibit of yi. inside of twelve months from this date.

Prospecting for Silver.-We learn that a party of $c$ italists in this city have associated for the purpose of anibing mining claims in the neighborhood of Colimo," of the richest silver districts in Mexico. A man of sc: tific attainments has been employed and sent forward) prospect the claims in view carefully and thoroughly. telligence of his arrival at Manzanillo has been received, $\frac{1}{3}$ his return is looked for in the course of next month. She 1 he report favorably, a cousiderable amount of capital wil $\theta$ an once embarked in the enterprise.

A NEW IDEA AND A GOUD ONE.
The Fimeralda Times, in speaking of the progress of the work upon the Stanfurd Tunnel in Aurora, nutices the folluwing ingonious expedient for furnishing light for the Workmen during tho day time :
The fumel, the mist of the day, is work ed without using candles. Mr. L. L. Ieming the Finamial Secretary of tho Comp ny and bacting Supurintembent, has found a more feofomical liyht; he uses the sun to work py. The tu nel is so mbirably situated and the cut hemy so wide, that it onables him, by the us of a mir.or, to reflect the full miys of the sun quite in to the end where the men are at work, and it is so light that a enper can be roud as easily as on the out ide.
The above tunne! is in ahout 150 fect, with a) open cat at its entrance, quite large ifexent and height. Miners in other local ith, driving tunnela, will do well to profit by th hint. The light istroduced ad above, is nuanly free of cust, but must be infuitely beth than that derived from candles.

Tipe is Truik of establishing a Stock Boarat farson City, N. T'. The local $\mathrm{P}^{\text {R- }}$ per the predicts success, should one be es tablish1. Why not?

Elmetcal Light in Paris.-The lighting of $\mathrm{H}_{\mathrm{is} \text {, it }}$ is stated, is to be intrusted to M. J. in Malderan, who has invented a new elege light, one jet of which is equal tw 2,200 Jy of gas. The llince Saint Sulpice is drined to be the first where the essay is to bried.
Quick $W_{\text {к. }}-\Lambda$ letter from West Point states, as arxample of the efficacy of the graduating $c_{s}$ of cadets that they dismount a cannon, and parate the parts of the car riage, and re-4e them, and fire the gua in 26 seconds.

THE COPPER INTEREST OF CALIFORNIA.
Notuithstanding the great altention which is now being attracted to the copper interest of this State, we apprehend that but a very imperfect idea of its actual present extent and importance is en ertuined by even well informed observers. ludeed, in the existing lack of statistical information, it is difficult for readers to inform themselves upon this point. The flush of excitamen which a few months since pervaded the public inind has, in a nutasure, passed away and given place to active aud persistent labor in developing the mines, and in bringing to the surfae and shipping to a varket the most valuable portion of the ores. Work enough of this description has been done to establish, beyond a doubt, a high value for quite a number of mines, and to affurd reliable data for impor ant calcalations and estimates with regard to the future of this new branch of nur mining industry.

It is now less than a year sin e W. K. Reed, the discorerer of the Union mine, in Copperopolis, sold six shares, or 975 feet, of that mine to the huuse of Meadur, Lolor \& Co. of this city, for the sum of $\$ 65,000$. The developments of the min- since that sale hare been su $h$ as to place its present actual value at fully $\$ 1.290$ per foot or $\$ 1,140,000$ for the interest sold by Reed. We have no idea that even the smallest interest could be purchased in this mine at the advanced rate above named. Probably $\$ 1,500$ would be a low estimate of the actual value of this mine per foot. We understand that no assessment was ever laid upon the Uvion Companys ground. Not even Washoe, with its famous Comstock lude of silver can make a better showing, in time and results.

Shipments of copper ore from this port to New York and Boston since the first of January last, inclusive of the cargo of the Mary L. Sutton, which sails, to-day, cannot be less than 4600 tons, with an argregate value of full half a million of dollars. This is independent of no inconsiderable quantity which has gone forward to Europe on fureign account. The ore thus shepped, it should be borne in mind, is only a small portion of that which has been raised As for instance, the Keystone mine has shipped, in all, from its first openi-g, abont 1200 cons. In getting out this amount, they have also raised at least 10,000 tons, which still lies at the mouth of their mine, as second class ore, which, when concentrated by the machinery now being erected, will make abuut 4000 additional tous of shipping ore as good as the average of that which has gone forward. The Linion Company has about 15000 tons of second class ore upon the surface, which is considerably richer than the Keystone, and which will probably yield, by concentration, ab at 7000 tons of fair shipping ore. These are the results of two mines only, obtained within about two years.

There are now some ten or twelve mines regularly shipping ore to this city, most of them in small quantities. it is true, but all pusting on the work of derelopment with an energy which gives promise of a rapid increase and an early magnitude of the copper interest, fully commensarate with the highest degree of importance which bas yet attached to it. In addition to these there are lundred of others which have been discovered, a large proportion of which will undoubtedly be developed into paying mines.

It has been feared by many that the great increase of the copper yield foreshadowed by the wonderful discoveries in this State, will so efiect the value of that metal as to bring it below the standard of a paying business. There need be no fears of that: Copper bas been regularly advancing in price for many years. Even the Lake Superior mines, although they have nearly douhled the yi ld of that 'metal have not even checked the advance in its price.

It is, or should be, a well known fact that the Copper mines of Cornwall are goving out-that is, their yield is changing from copper to tin. Many of the once productive mines of Cornwall are now workedfur tin only, the copper having gradually run into that metal, as the depth of the mine has increased. Chili, another great source of supply, is also d creasing its yield, with a fair prospect of an almost total cessation thereof. The fact is, the discovery of some new copper field had become almost a commercial necessity, when a fortunate a cident turued the attention of California miners in that direction.
It appears to be one of the laws of an Overruling Providence that in all the great interests of human industry the supply is made to keep pace with the demand. The discov-

Igran powder are noticable instauces of this great law. The discovery of new deposits of the precions metals had become almost a necessity to the increasing commercial wants of mankind, when the new gold fields of Cali-ornia were opened up. So of silver in Washoe, and co! per, of a later date is no excep ion to this general rule. In supprrt of the position we hare taken with regard to the copper yield, we give the following from a ricent number of the London Min ing Jouronal:
"It appears from all informatiou that can be obtained that the demand for metals is greatly on the increase, amil min increase ns nation after nation see the the necessity of adonting liberal tariffs. The Copper Mining Interest has-suffered more than any other branch of miving enterprise during the last two years. A wide spread rumour was circulated, some montlis ago, that the stuck of copper in Englaud was much greater than for many years past; but such is not the fact. The stock at the present time is, actually, much below what it has been for several years, und the returns from the mines, generally, greatly on the decline. At least twenty of the greatest min+s in Cornwall, during the last forty jears, may be said to be almost exhausted-for copper, and some of them are now ranked as tin uines, only. Several of the mines in Chili are reported to be nearly exhausted or buve ceased to be of any commercial value, as they were surface deposits, principally, and the copper not found in regular veins or lodes as in this country; but mere curbonas or blocks of copper on the surface. Foreign mines will not pay, as a rule, at a standard under $£ 140$ ( $\$ 700$.) No duubt legitinate speculations in copper mines, at present, are some of the safest investments the pablic can embark their spare capital in."
Neiv Quartz Mul.-Mr. Johu Center of the Mission Gardens, is putting up a Quartz Mill capable of reducing about 12 tons of rock per day, on Center Street, near the Mission Bridge. This Mill is heing erected for experimental pardoses. It is a crushing mill, on the principle of that now employed for similor purposes at the fuot of Market St. The crushers will be graduated 80 as to bring the rock to the required fineness by a succession of rollers, after leaving which it will be sulijected to the action of an improred Chili mill process. The amalgamating nachinery will also be constructed on a new 1 rinciple. We shall give a particular and probably illastrated description of this mill and machinery, when completed.

The Hepbern \& Pierson Pan is a nev amalgamating pan which has recently been introduced into use at Virginia City, and which is highly spoken of. The Esmemalda Star says that it is about being put up in Gregory's mill, at Aurora The Slar further attests to three separate trials of this pan with as many others of different construction, in which the Hepburn \& Pierson pan each time excelled its competitora. We have no knowledge of the merits of the pan, and know nothing of the principle upou which it operates. If the proprietors have a good machine, they will fiud it to their adrantage to have its merits properly placed before the pullic. Illustrations are given in this paper, free of cost, where the parties furnish their own plates.

Pactific Board of Brokers.-A Board of Brokers, under the above title, was organized in this city on Tuesday, August 18, 1863. The following gentlemen were elected officers of the Board : James Hitchens, President: Wm. P. Denckla, Vice-President ; Jas. H. Gager, Stcretary; T. D. Mathewson, Treasurerer ; Chas. H. Watson, Sergeant-atArms. The Board meet daily at 12 M ., for business, in the new rooms of Thos. Maguire, No. 606 Washington street, near Montgomery.

Erom the Colorado.-Tho Los Angeles Slar says: Capt. Johnson, who arrived this week from the Colorado, brings with him specimens of ore, the richest yet exbibited here. Out of a piece of rock weighing two and a quarter pounds he ob tained fourteen ounces of metal, copper and silver. For the want of proper implements he lost probably one-third of the metal. There are thousands of tous of such mineral on the surface: and it extends for leagur s .
Chrap Tranfling.-A New York journalistjays he made trip from New Fork to Europe, pail for his passage and everything he had, journeged orer the continent and passed four months, for four hundred dollars.

## GAS AS A MOTIVE POWER.

The Paris "Scientific Press" gives a lengthy description of a new motive engine recently invented by M. Hugou, of that city, together with a philosophical explanation of the principles on which its action is founded. The article is quite too long to be transferred to our columns.
The idea of the application of gas as a motive power was first conceived abont the year 1853. From that time to the present much ingenuity has been devoted to reducing it to some; practical result. Moilels of the varions improvements have been preserved, so that the curious in such matters can casily trace the gradual development of the idea, and identify the various stages of the discovery. The machine now pre sented by M. Hugon is described as being correct in principle and emiuently practical in use.

## dhscription of the aas engine.

The generator, which corresponds with the boiler of steanengives is a curved tabe, in the form of the letter $U$; he summit of the smaller arm bears the valves of escape an of introduction, and the larger arm is provided with claks, which remain closed by their own weight. The clacks pen in the bottom of an upper reservoir. In a certain part (hich is variable) of the great arm of the U tube is placed awelling, which serves to connect the tube with the cinder. This is similar to the cylinder of a steam-engine, wh this exception, that it bears two openings for the intrlaction and two for the escape, of the liquid. Over these orifices are placed four slides, two of them being in comrnication with the vacuum tube, and two with a basin irvlich the water driven from the tubes can be evacuated, tb water heing firstly poured out in the reservoir which suounts the large arm of the U , and then passed into the bin by an over-flow pipe. The piston communicates the otion to a first-motion shaft, upou which ure geared thlifferent machines for giving movement to the pumps, orellows, of air or of gas, as well as to the different slidef the tube or cylinder.
These gencrators or tubes, above descrik, may be increased indeffinitely, as it may be desiral, to increase the power and so connected as to transmit to common cylinthe vacuum produced.
To cause the machine to work, it is nessary to fill with water the U tubes, the reservoir up to $\ell^{\prime}$ overflow-pipe, the swellings that put the second branches the two generators in communication with the cylinder, $\mathrm{t}^{\text {cylinder }}$ itself and the basin, up to a certain point. W) the various organs of the machine are filled with water, ertain quantity of the explosive mixture is introduced ${ }^{\text {ne }}$ valves at the top of the first generator, whose ignition letermined by the eleatrical spark, or by an incandescenktinum wire, or by a gasjet. The dilatation of the gases irried immediately to a very high temperature, drives a tain portion of the water of the generator with great for hrough the clacks of the great branch, into the higher rvoir, which, in turn, allows it to flow into the great basin

The valves are then openind the piston is advanced by the motion of the slides :onsequence of the vacuum upon one face, and on pther by the water exposed to the atmospheric pressure, ${ }^{1 \text { a force equal to the difference }}$ of the pressures exercise the two sides, or, to speak more plainly, with a fore ual to that of the vacuum produced.

The piston, in advanc, causes the water which is npon the face directed towar he racaum to replace a certain portion of that which 1 bed driven ont of the generator by the combination of egqs. When it arrives at the end of its stroke the msent of the slides is reversed.

The above descriptior if efully read, will convey aome idea of the priaciple of $s$ new and ingenious machine, which, may yet become an prtant instrument in advancing the great industrial commercial interests of the world.

The speed of rotatio the machine will depend upon the number of the geners tabes, and the dimensions and forms of the openings for introduction and the escape of the water of the cylinde ${ }^{t}$ does not produce, in working, any ribration, or shock ${ }^{15}$ kind; the heating of the water of circulation, aft day's work, never exceeds 1330

Fuhr. ; and the consumption of gas is abuat 53 or 56 cubic Feet per hurse-puwer per hour.
The Einglish Jour.al of Gas Lighting, from which we collate the above, promises further particulars with regard to experimental results. which we shall transfer to our columes whenever they come to hand.

## RIGETS OE WOMEN TO HOLD MINING CLATMS

A correspondent of the Firceinia City Union informs that journal that sume "smart individual " iu the Monitor District is trying to secure mining ground and make his furtume hy re-locuting, in that destrict, ull the claius that have been recorded in the names of women. The correspondant is hlso desirons of learning what rights women have for holding mining ground. The Lditor of the Union correctly iuforms his correspundent that in law, husband and wife are one person, therufure no man can, by using the name of his wife in locating, hold two claims upon the same ledge. Of course this would not prevent him from locating a claim for his muther, sister, cousin, or any femate in the world whose hosband was nut a locator un the same ledge, nor would it be any bar to the busband or wife acquiring, by purchase, an interest in the amme ledge in which the other owns by location.
Plain as is the above proposition with regard to the unity in law, of man and wife, it is, nevertheless, not an uncommon thing, in many localities, for the name of the man and wife to appear as locators on the same ledge. Of course such titles are invalid. It is feared that puch litigation is in store with receards to titles so held and conveyed. Much valuable nining ground in this State, has recently changed hands at high rates where the original title comes from locations made by man and wife upon the sane ledge. Capitalists will do well to look closely after the character of their titles. There is a degree of looseness manifested with regard to mining titles thut is seen nowhere else. There is no reason why the same circumspection should not be employed in searching into the validity of a mining title, that is always employed in looking fafler a purchase in real estate.

## SILVER CITY, N. T., MINING NEWS:

Tre Lady Eliden.-The Larly Ellen Company's mine is situated in Silver City, near the spot where the roads to Carson and Daytun branch. Work upon this claim, which is one of the most promising in Silver City, is progressing energetically. The company are hard at work upon two shafts, jiinking night and day, and have continued to take out pay rock from the surface down. They are now shipping rock to the regular mills which will pay about $\$ 60$ a ton.
The Champion.-The Champion is one of the best claims in Silver City. It is worked through a tunnel some tro hundred feet in length; the ledge ranges from four to seven feet in widtn, and the rock pays about sixty to seventy dollars a ton. The crushing is done at Gears' mill in Carson.

The Proneer Clalm.-Very rich rock was recently struck in the Pioneer Company's claim, Silver City. This claim, as its name imports, was among the earliest taken up iu the TerIritory.

Ther Carsox Clain, in Blue Sulphur Spring District, has recently tarned out some fine looking ore.

State of Washof.-Provided the people ef Nevada Territory vote "Constitution, yes" on the 2nd day of September next, the delegates elected will assemble at Carson City, on the frist Tuesday in November to frame a State Constitu tion.

Pike's Peak.-The Denver News says matters are look ing up in Colorado Territory. In some localities miners are realizing from $\$ 10$ to $\$ 30$ per diem 10 the hand. Georgia, American, Galena, Delaware, Gold Run and French Gulch. es, are said to be paying immensely. Everybody has plenty of money, and such prosperous times were never known before in those diggings.

The Pacific Mineral Company are shipping, the present week, to England, ores of copper, gold and silver. This shipment is made per ship "Orpheus."

The Tearl fishery in Ceylon the past year has realized over a million dollars.

## THE MINING SHARE MARKET.

The excitement in the Mining Share Market heretofore, of late, nuticed has somewhat subsided. Operations for the week past, though embracing quite a wide range of stucks, have been, with a few nuticable exceptions, rather at declining rates.

Uphir has advanced to $\$ 2,500$, on thirty days; Gould \& Curry remains firm at $\$ 4,750$ ( 1 . \$4, 800. A few Augus dividends have been sold for $\delta 147$ hy inresolute holders. 'The more prominent holders of both Uphir und Gould \& Curry, manifest quite an indifference to their market value, having fill faith in the mine as a permaneut dividend paying institu-
tion.
Chollar, early in the week, declined to $\$ 000$, but soon recovered to $\$ 1,200$ and closed at $\$ 1,100$, with small sales.
Potosi has advanced $\$ 125$ and is quoted at the round figre of $\$ 1,000$, with a firm market.
Sierra Nevada has been a favorite of the week. We quote at $\$ 100$-a material advance. Shares to the number of 422 have changed hands at rates ranging from $\$ 87 \frac{1}{2}$ @ $\$ 106$.
Daney has been largely dealt in ; 597 shares having changed hands at fluctuating rates, ranging from \$105 @ \$150.
Buckeye still continues the fancy of the market. It opened the week at $\$ 40$, a small advance, soon reached $\$ 48$, and finally closed at $\$ 371 / 2$, a shade lower than the figure with which it closed the week previous. Several hundred shares f this stock are reported among the sales of the week.
North America, at Gold Hill, has been considerably in favor, 418 s hares having changed hands-fluctuating from $\$ 50$ (a) $\$ 67$.

Overman shares are still growing in favor. Opening with $\$ 390$, the closing bid of the previous week, they steadily advanced to $\$ 495$; and at the close $\$ 510$ was bid without finding sellers.
Burning Moscow, not much dealt in; dull at $\$ 85$. North Potosi, at $\$ 40$; Lncerne, at $\$ 25$; Lady I3ryan, $\$ 121 / 2$; Meredith, $\$ 50$; Burnside, $\$ 5$; El Dorado, closed at $\$ 70$; Sacramento, $\$ 80$; Madison, $\$ 20$; Bullion, G. H., 69 ; Pride of the West, $\$ 95$; Grass Valley, $\$ 60$.
North America, Gold Hill, has been much in favor, fluctuating from $\$ 50$ to $\$ 67$, with a large business.
Esmeralda shares have not been largely dealt in. This district still seems to rest under a cloud, but the enterprise of its mining population; in their resolute sfforts to develope their mines must soon bring it out brighter than ever. Strangers visiting that locality, are invariably surprised at the representations of the bears and other interested parties, in this city, with regard to the value of the mines. The camp is evidently deficient in effective mills, yet the average of the rock crushed there is fully equal, if not in excess, in point of yield to that crushed in Virginia City, 'The mines here are in fact just beginning to be developed, and it is safe to predict that another year will bring about results in this
locality that will astonish even the must sanguine.
Wide West has peen very little sold; dull $\$ 145$; Esmeralda, $\$ 25$; Bamboo, $\$ 30$; Pond, $\$ 373 / 2$; Falls of Clyde, $\$ 5$; Ural, $\$ 1621 / 2$.

## Josephine, Coso District, has been cousiderably delt in COPFER.

The Copper interest still continues to attract a large share of attention. The regular arrival of ore from the interior ; the gradual increase in yield of the older mines and the continual addition of new ones to the catalogue of those producing ore, considered in connection with the increasing aggregate of shipments East, to domestic and foreign ports, is giving a degree of importance to this growing interest which cannot fail to arrest the attention of our moneyed men. The "Mary L. Sutter" sails to-day, with about 600 tons of ore from the Napoleon, Union, Copper Hill and Alta mines. The The Preific Mineral Company are also shipping, this week, per the "Ospray," to England, both cupper ores of gold and and silver, Active prospecting operations are still in pro-
gressing throughout the entire copper region, and quite a gressing throughout the entire copper region, and quite a
number of mines in addition to those already shipping, will soon commence sending their ores to market. The Wilson Copper mine, some six miles above Lincoln, is now putting up a twenty-horse power engine for hoisting and pumping, and will commence shipping ores as soon as their machinery gets to work.

## SUGGLITIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general
rule, any invention which is valuable to the patentee in this country, is worth equally as much in Bingland and some other foreign countries. Four patents-Americau, Euglish,French and Belgian-will secure an iaventor exclusipe monoply 10 his discovery among one hundred millions of the most intelligent people in the world.
The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign coantries are obtained through the Mining and Scientific Press Patent Agency. Haviug established Hgencies at all the priucipal Eurnpean seats of Government, we obtain patents in Great Britain, France, Belgium, Prissia. Austria, Spain, ete., with prumptuess and dispatch.

Models are not required in any European conntry, but the utmost care and exper cuce is necessary in the preparation of the specifications and drawingse
When parties intend to take out foreign patents, engraivingsshould not be published until the foreign applications have been made.
Caurion.-It has becoune a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such-applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrast their cases to the care of a competent, reliable agent as nome.
While it is true of Most Eurupean conntries tbat the gystem of examination is not 80 rigid as that practiced in this country, yet it is vastly important that inventors should bave their papers prepared only by the most competent solicitors, in order that they may ataud the test of a searching legal examination; as it is a common practice when a patentee finds a purchaser for bis invention, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of irusted with valuable inventions.

## msderalda mining trens

Tee Untontilee Tunnel Co., which commenced work in February last are pushiug ahead vigorously. The Star sayo that this tunnel is not surpassed in workmanship by any other tunnel in the district. It is now in a distance of 375 feet. They have already struck four well defined ledges; the first of which will pay for working; the last one however which has been struck at a depth of 275 feet is a rich one in which free gold can be plainly seen. It is expected that this enterprise will bring to its owners a rich reward. It pierces the richest purtion of Last Chance Hill.
Tite Lawton Ledae, on Silver Fill has a shaft down to the depth of twenty-five feet. They have a lode about four feet wide.
The Stanford Tunnel is now in about 150 feet. The latest indications were that they were is close prosimity to a ledge. The workmen are now taking out rock of a bluish, green color, of a character which often lies contiguous to a silver bearing vein, and which almost invariably contains chloride of silver. This tunnel is bound to be one of the best paying enterprises in the district, its locatiou is particularly advantageous, being at right angles with all the rich ledges on this side of the hill.
The Enterprise Tunnel is about six hundred feet in length and running into Last Chanee Hill. Very recently they struck a ledge seven feet wide. The rock shows sufficiently to justify-as some of the holders think-a raise in the stock.
The Times says the Clan Alpine company has a lot of rock at the Brodie mill. and will soon know by actual practical illustration what it will pay.
Tre Koran Ledge on Last Chance Hill is having a prospecting shaft suok.
The Cortez Consolidation Co., on Silver Hill are sinking a prospecting shaft.

Rich, -Twenty-one tons of ore from the Aurora lode, one of the ledges belonging to the Real del Monte Consolidation, yielded at a late cru-hing $\$ 4,347$, being $\$ 207$ to the ton. The ore was not assorted. There is no danger that a mining district turning our large quantities of such ore as this, will ever fail to sustain itself.
The Union Foundry in process of erection at Aurora by Mr. Geo. W. Coffee, is nearly completed. The Times speaks most flatteringly of the completeness of this institution, and justly calculates on large advantages to be derived therefrom for that camp.

## REMOTAL.

The Office of the Mintigo and Scirntific Press, has been removel to Rooms Nos. 56 and 57 Government House, cor ner of Washingtun and Sansome Streets. We bave been indnced to make this change of location, not only with the friew of securing mure room and better accommodations for forselves, hut chiefly to better accommodate persons haviug pasiness with the office. Our location is now central, easy Sf access, and in the direct way of the chief travel of the city to and from the Post Office.

## ON FLUXES.

This subject is one which has been brought before the pablic of San Francisco, this week, by several of our conttemporaries, und one flux which has been rariously described, us "a silicate of cadmium," a silicate of manganese," and a siliious deposit containing animalcuke," has been considerably anded for copper-Roasting, or sometling els in addition, or as a pri liminary, being omitted, or not, according to the judgment of the operator. Amid all the mystery this sppears to contain, we have been shown copper, melted then this "flux" (?) has been used conjointly with another. We have also seen battons of copper obtained whern "prefious knowledge of smelting ${ }^{13}$ was employed, and where, herefore, something tangible besides this flux was probably uit in the pot. These are the only anthentic cases of sucless we have heard of. We know failures abound. One of |he'successful manipulators admits that it is not applicable ior use in a cupola. In contrast with this, we cite from a ecent paper by our rising chemist, Prof. Joy of New York, fie following beautiful application of scientific knowledge to bis subject.
In treating beryl, to obtain glucinum, "One part of beryl ras fused with three parts of fluorid of potassium; and difested in sulphuric acid." He adds: "If this flux could be btained in sufficient quantity, the method would be preferabe to all others, as the mass fuses easily, the fluorid of silcon is driven off at a gentle heat, and the potash alum rystalizes readily, carrying down all of the alumina, thus t the same time accomplishing the decomposition of the filicate and the separation of the alumina and glucina."
Grological Position of tie Vhins of Precious Metals N Wasmoe and Reese River.-The Rcese River Reveille aays:-The mines of Washoe are in syenite, porphyry, and ther granite rocks. Reese River presents one series of hines in granite, as about Austin City; another in metamothic shales, as in Smoky Valley and Big Creek. The Comet ein traverses slate. The heaviest masses of native metallic filver have been found in veins traversing slates; and; on he other hand, the large masses of cholride found in South america have been the product of veins in metamorphic limeone. Oxyd of silver is a rare ore, but is occasionally met ith in Mexico and South America, and in the veins about ustin. It is mostly found in veins traversing granite."

## [cumnusioatei.)

Mr.Edrror :-"A Poor Chemist" will find the properties of Iydrochloric acid wheo used in qualitative analysis fully Corespandents from Esmeralda report large quantities of men of ling ling around the mines, bening large shipments of man of the Royal College of Chemistry, London. You may'bullion duriag the approaching Fall and Winter. A lack of rest assured. Mr. Fditor, that I will not mislead yonr nnmer- facilites for crushing keejs this treasure back fur the present onr readers in describing to them the tests for metals. Did A correspoadent of August 2d writes:-
time permit me, I would naswer "A Poor Chemist" more fully, and ere I complete these papers I may fall upon him again.

Fron El Dorado Countr. - We have been shown some very good auriferous rock from the Batic and Harman ledges of Placerville. The Baltic, at a depth of 25 feet, is produc ing rock which yields twenty-five dollars per ton.
The Hoffman at a depth of 75 feet is producing 35 dollars to the ton. It is believed that these ledges will rank second only to the New York mive, of that vicinity.

Tar Newsom Gold and Silver Mining Company is located half a mile from Silver City, and is the north extension of the Bnckeye. The Company have sunk a shaft on the ledge to a depth of seventy-five feet; and are taking out about two tons of puy rock per day. The ledge is six feet wide, stendily increasing in width and richness. There are now out about 40 tons of quartz which the Company intend to crushed at one of the adjoining mills, the proceeds to be used in developing the mine.
Sulphor.-A large field of Sulphur has recently been dis covered, near the Lassen Meadows on the Humboldt. It covers some sixty acres, from one to three feet thick, so far as explored, but it is thought that further explorations will develope its still further extent beneath the surface of the ground. This discovery is a very important one, to that dis trict of country, as it will afford an abundant and cheap sup ply of the raw material to the sulphuric acid manufactory now about going into operation near Carson City. This fao tory, alone, will consume about one ton of su'phur each week. As the mines are opened up other factories will soon be required, and an enormous quantity of this material will be needed soon.

New Mining Sutis in Washoe.-The following mining suits were commenced in the District Court at Virginia City on the 19 th and 22 d inst :-Heiss vs. Woodruff et als., to recover thirty-seven and a half feet in the Belcher claim, Gold Hill. Patrick Keenan vs. H. Harris \& Co., to recover the sum of fifteen bundred dollars. A. S. Olin vs. Samuel Welch-attachment suit. Joseph Barnet vs. J. H. Mallett to obtain an injunction restruining a suit in the Civil Probate Court by defendent against plaintiff, for possession of a store on C street, adjoining Wells, Fargo \& Co.'s. Potosi Gold and Silver Mining Company vs. Junction Gold and Silver Mining Company, to obtain an injunction restraining the Junction Company from working on ground claimed by the Potosi Company.

The oluest newspaper in the world is printed at Pekin, in China. It is upwards of 1000 years old.
"The Del Monte has a large amonnt of quarte out, but is not working now. The Pond is in the same position. The Utal is hard at work, and has some 60 tons of ore at Gregurg's mill to bo crushed. From the kind on hand at the mine, the chances are that it will yield largely. The Western Summit has une of the finest openol mines I have seen; the rock looks fine, and the Company will have a crushing so soon as the Ural rock is worked. Burlington ledge looks well, is clearly defined, and free from all "entangling alliances." The shaft is down about forty feet, and is being worked day and night. The Clan Alpine, in the same vicinity, looks well; 16 tons of their ore crushed last week at Bodie's mill yielded $\$ 86$ per ton. Work on many other prominent claims remains pretty much as at my last.
In the town, building is going on steadily, and by winter time we shall have a number of as fine brick buildings as can be found east of San Francisco. The wnather is warm, and the general health of the inhabitants is good."
The Croesus, owned eutively by Mesars. Cralle and John-' son, on Last Chance Hill, is down to the depth of sixty feet, and the rock increases in richness as they go down. The gold is plainly visible in most'every piece of the rock assorted for crushing. Twenty tons have been sent to the Pine Creek Mill to be crushed.
One shaft of tho Antelope is down 140 feet. The rock all the way down increasing. in richness.
Su, ver hill consolidation keep men steadily at work taking out ore and developing their mine. The Brodie mill worked a lot of their ore recently-the yield of which we have not yet ascertained.
According to the Times, the Howard Company have struck it rich. A ledge has been found which surpasses any ledge that, has yet been found in any tunnel in Esmeralda District. The work of running through the ledge is progressing, and fronr present appearances it will take several days to work throigh it: The thiniel is in a distance of three hundred and forty feet, and is now in the mineral range and liable to find valuable ledges at any time.
There has been considerable talk about Bodie district within the last few weeks. From all accounts, the ledges and claims there are large and well defined, clear of all dispute, anid, so far as opened, rich.
The Bamboo has nearly completed its air shait, and rich developments are looked for, daily, in that mine. The Crockett is taking out large quantities of fine ore, and will soon have another crushing. The last lot of 80 tons yielded about $\$ 80$ per-ton.
The Ural Company has ten men steadily at work taking rock from theis vein. At the depth of 120 feet the vein is 7 feet wide with the rock improving, as the workmen descend.

## THE MINERS' LABORATORY.-NO. XIII. <br> SILVER.

Fahlerz, (Grey copper,) lustre metalic, steel-gray, iron black, dark red, rather brittle ; specific gravity 4.5 to 5.2 .
When heated in an open tube it yields fumes of antimony sulphuric acid, and sometimes arsenic. Before the blowpips on charcoal, decrepitates, emits the smell of burning sulphur, deposits a sublimate on the charcoal, and melts easily into a steel-gray slag, which is usually magnetic; and with borax melts into a gray metalic globule of copper.

Occurs in beds with talcite, chalite, quartz, in veins with galena, blende and baryte.

Freislebenite : lustre metalic, steel-grey, streak the same, brittle, specific gravity, 6,00 to 6.38 .

Before the blowpipe on charcoal deposits a sublimate of oxide of lead and antimony, and yields a globule of silver which sometimes imparts the color of copper to borax.

| Antimony, | $\ldots$ | 27.05 | 27.72 |
| Sulphur, | $\ldots$. | 18.71 | 18.77 |

Occurs in crystals, massive and disseminated.
This is a very rare mineral, and is found in veins in gneiss with galena, antimony, pyraryyrite, pyrite, chalybite, caleite quartz.

Proustite; red silver, (in part,) lustre adamantine, cochineal red, carmine red; streak, aurora red, cochineal red; slightly sectile; specific gravity, 5.5 , to 5.6 , decripitates when hested ; melts easily before the blowpipe on charcoal, yielding sulphurous acid and a strong smell of arsenic, leaving a brittle globule, reducible with difficulty to pure silver. Partially soluable in nitric acid, leaves a residue of sulphurous and arsentous acid.

## MINING PREMIUMS.

The "Washoe Agricultural, Mining and Mechanical Society," will present at their first Annual Fair, which is to take place, on the second Monday (12th.) of October, amone their largesi awards, the following important Mining Premiums :-
Class 13-For the best geological cabinet, best collection of ores, best exhibit of gold specimens, best exhibit of coarse gold, best exhibit of scale gold, best exhibit of flour gold, best exhibit of copper ore, best exhibit of iron ore, best exhibit of galena ore, best exhibit of cinnabar ore, best exhibit of coal, best exhibit of salt, best exhibit of alum, best exhibit of gypsum, best exhibit of petrifacation, best exhibit of lead, best brick of silver bullion, best specimen of east steel, best specimen of maleable iron, best specimen of rolled shafting.
Class 15.-For the pest plan of tumnelling, best plan of timbering tunnels and shafts, best collection of mining imple ments, best steam engine for hoisting purposes, best horse power for hoisting purposes, best derrick or whim, best dumping car or apparatus, best car track, best six tanneling shovels, hest six crowbars, best six drills, best six sledges, best machine for tunneling by motive power, best quartz carrying wagon.

Class 16-For the best arranged and most complete quartz-crushing mill in the Territory, 2 d . best quartz-crushing mill in the Territory, 3d. best quartz-crushing mill in the Territory, best quartz-crushing machine, 2d. best quartz-crushing machine, best set of amalgamating pans, 2d. best set of amalgamating pans, best amalgamating process, 2 d . best amalgating process, best india rubber machine belting, best leather machine belting, best anti-friction journals, best şelf-oiling boxes for shafts, best brick machine.

## THE EMPLOYMENT OF STEAM.

The "Journal of the Franklin Institute" gives the following useful and practical ideas upon the Employment of Stean. They will be read with interest by the mechanical portion of our readers:-
Hioh Steam.-It is well understood in the world of practical engineering, and is confirmed by correct theory, that it is much cheaper to make high steam than low steam, from the saving in fuel to produce equivalent power, the improved condition of heat convection in the boiler contents, the comparative losses by external radiation, and the resultant increase, by superheating. $* * * \mathrm{Up}$ to a certain range of heating ( 5500 ,) iron boiler-plates increase their strength, while below a certain tension, which is far within the limits of ultimate strain, a boiler is as safe from one pressure as another, in reference to the usual sources of danger from disruption and explosion, which rest so much on careful attendance. As a safety under working strain, we believe that there is little to be feared from steady pressure, even at ranges which may be called excessive, and we have slept over 180 and 200 pounds of steam, after some study of the attention of the firemen to the gauge-cocks, confident of as great salety as over one-fifth or one tenth the gauge.
Superbeating- Some positive means of giving all boiler steam the benefit of this process, should be adopted. Among all the extravagnt claims of enthusiasts on this subject, which have induced a general re-action, too much has been proved as to its benefits to be lightly disregarded, up to a certain moderate range of application; and by this we mean an application more distinct and more clearly defined than the ordinary process of superheating common to boilers with chimney uptakes or steam domes. If saturated steam, by the addition of from 7 to 75 degrees of heat, will be expanded from 10 to 30 per cent., as some experiments have it, and such increment of heat can be conveniently taken from the Wasted gases of combustion, there is great propriety in the application; and granting the special claim to be erroneous as to gain, if the steam can be fortified agrinst the steampipe, chest, and cylinder radiations and condensations, so as to show the boiler pressure on the indicator-cards, even this result is worth the slight cost of attaining it. In most of our engines, the losses between the cylinder and boilers are formidable in their percentage of coal waste.

Inproved Conduction.-It is urged by some authorities, and endorsed by experiment, that the use in boiler-flues of condacting-pins about 3 ins. long, projecting downward, into the heated currents, by presenting much more favorable points of heat transmissiun than the smooth surface of the Hue-sheets, improves the evaporation. The application is simple and is justified by the conditions of furnace-fine action.
Summary.-The general lesson taught by the diversified forms and operations of boilers, and the principles of their action, is, that the great majority come far short of available natural results, from imperfect design and management, and that the simpler forms are practically and theoretically to be preferred.

Tre largest cask in the world; that was, has had its light diminished. That of Heidelberg has now a rival in a cask rec ntly made at Dover, England, Eight conples danced on the top. The cost of this mouster cask was Two Hundred Pounds sterling.

Union Mine, Russ District.-The following extract a letter from a correspondeut, at the Union Mine, Russ I trict, should have appeared several weeks since. Its de has been caused by the letter having been accidentally n laid. The writer had just arrived in that regiou to ti charge of the above mentioned mine. He writes:-
"The day following I visited the Uuiun Company's M (Eclipse Lode) of which I had engaged as Superintende, and was agreeably surprised at the Champion like appe ance of the same, and especially at the strong indications near the surface, of its becoming, in depth, productive. may say that I felt a little proud, at the disappointment; when hearing of the time in which this mine has been in eration without any satisfactory results to the owars, I mo er expected to have seen a lode of delicate promise, inste I was not long in forming an opinion that the canse of delay of "glad tidings to the proprietors," was owing to scratching at surface, instead of developing the mine depth. The Eclipse is a regular and well defined Lode, has in its component parts all the prevailing characters the most productive ledges in the State, and will, judg from present appearances and the vast amount of grol the Company claims, at no distant period, stand promil in the Share List.
The work on this Lode is confined at present to the si ing of an incline shaft, and driving a crose cut tunnel. B are being operated on day and night. In the incline lode is 10 feet thick, bat at present, to facilita'e its sidk there is only 6 feet of it from the foot wall up being carr most of which is so strongly impregnated with gold thr have recommended the Company to forward as many $p$ for working the same in addition to our stamps, as the gine is capable of driving. The remainder of the lode i present more adapted for silver and from the upper part i. by no means difficult to break blocks of mineral of 500 weight, much resembling in appearance the Sheba. Aft little further sinking in the shaft, we shall commence driv tunnels each way, on the course of the lode, sinking in mean time. A cross-cut tunnel is now being run to in sect the lode at a depth of 300 feet under a portion of vein, where, for a cousiderable distance, the croppings li remarkably well, and show much gold."
The writer of the above speaks encouragingly of the mi generally in that region, as well as the Owen's River of project.

Learn to Forge Your Own Tools.-Many mechan says the Scientific American, have an idea that after $t$ have mastered the more legitimate duties of the worksl they have learned all that is necessary, and can undert anything in their line of business. Machinists particul are prone to this error-a common one, by the waythink that a knowledge of fitting and turning, once acqui makes up for all other deficiences. In reality, the self-sty inished mechanic is, paridoxically, the unfinished one; he who acknowledges his short comings, and tries to con them by obtaining all the information he can, will acqui more thorough knowledge of his profession. Comparati few machinists are competent to dress their own tools, ádeed, handle the blacksmith's hammer on any work. I many times such knowledge would have been invaluable leave individuals to decide from their own experience. simple weld which they were unable to make, a faculty dressing chisels without putting their own eyes in dange striking the anvil instead of the tool, would assuredly he stood persons ignorant of such details in good service 1 time of need. Apprentices who go to the tool-dresser bave the edges of their chisels or other instruments ren ed, will do well to observe the process and inform themse of it, instead of throwing coal at the helpers or otherit conducting themselves in an unseemly manner. Obse sion and experience are twins and inseparable, and no yt or indeed any adult can hope to attain eminence or $p$ ciency without paying some respect to the matters he alladed to.

Ir is said that tobacco smoke blown into a wound is is almost infalible cure for the lock-jaw.

Gratitation bas been beautifully defined as the outsp d and of God forcing all things into their place and kee, $g$ them there.

Tabathent of Auriperious and Argentiverocta Copprr Ores.-An improved mode of manufacturing copper from ores has been provisionally specifed by Dr. T. Fleitman, of of Iserlohn, Prussia, according to which the copper ores are first ground to powder; then one part of such powder is roasted dead, and mised with the unroasted portion, and the whole is smelted with a suitable flux, such as silica or the slag of a previous process. The smelted mass is run into water, and the product ground to powder : and the process repeated until the resulting sulphuret of copper is in the desired condition. The sulphuret of copper obtained is ground to powder asd roasted dead, then moistened with an alkaline solation. The oxide of copper is sabjected to heat to melt the alkali, but not the oxide copper, which is then well washed in water: the product obtained is mised with powered carbon, and then melted.

New Salt Mines.-The bark Carib has lately discharged a cargo of salt at this port, from the mine known as Oje de Liebre, at the head of Scammon's Lagoon on the Pacific side of the Paninsula, Lower California, lying in latitude 28 degrees $10^{\circ}$ minutes, and 114 degrees 50 minutes longitude. This mine is of great extent, and inexhaustible. The beds from which the sult is taken are ten inches to five feet in thickness, and continually forming.

More Gold in Canada--We hear from Canada of the finding of an abundance of gold on the tributaries of the River Chandiere, about fifty miles above Quebec. One nugget weighing 20 ounces of pure gold was picked up in the bed of one of these streams. Another, weighing nine ounces, found near the same place, was sold in Quebec. The news has of course created a great excitement, and people are flocking in crowds to the spot.

## NON-DIVIDEND PAYING MINES VALUABLE.

The list of companies which we gave, in our Supplement exhibits a degree of activity in mining matters, never witnesed be fore, either in Califormia or any other country. We notice, on the part of many of our cotemporaries, a disposition to look upon this remarkable movement of organized capital as a matter of almost entire speculation. It is admitted that the stock of a few of the leading companies like those located upon the Comstock ledge, is valuable; but that outside of those, there is little else than "wild-cat." "Wild-cat speculation" is said to be the chief business of those engaged in getting up these companies, and nine tenths of the mining stock in the market, is pronounced "good for nothing except to excite the hopes of simpletous and thereby rob them of their money."

That there is a moiety of truth in the above may be correct, but we are not willing to admit that there is any adequate ground, whatever, for the sweeping charges which are so frequently brought against those engaged in the general mining operations of the day.

With many, all low-priced stocks are looked upon as "wildcat;" but with that deffinition of the term, there can be no medium between "wild-cat" and legitimate, divilend paying mines. All mines, with now and then a notable exception, must go through a process of development to ascertain their full value. There are certain indications upon or near the surface of every mine, well known to the experienced miner, upon which deductions of a favoralile or un unfavorable nature can intelligently be made; and upon these the miner must determine his course of proceedure. As the work of development progresses, these indications are more or less favorable; and of course the price of any particular stock meets with corresponding fluctuations, untrl such a time as the mine is fully developed, and becomes a regular, dividend paying institution. The price of sook is thereafter graduated by the amount of dividends which it can be made to pay.

The fact that thousands of mining companies are being organized at the present time, is simply an evidence that there are that number of promising lodes of mineral in the country which are worth prospecting. Any person who has kept himself posted in mining intelligence for the past few months, must be aware that within that time, an ulmost illimitable extent of valuable mining territory has been opened $u p$ to explorers, throughout the entire extent of which mineral cropings and indications of most undoubted value have been found. When a vein is once discovered, it is usually found to traverse an extent of ground upon which from four or five to adrzen or more companies may be eligibly located. From forty-five to fifly companies have undoubted locations on the Comstock vein, besides a large additional number who claim such a location, but which may eventually prove to be upon side veins or spurs. The marvel is, under the circumstances, that there are not more, rather than less companies now organized. The plan now so generally adopted for prospecting and developing the mines is p-rfect ly legitimate and equally as advantageous to the capitalist as to the miner. Ordinary precaution, only, is needed to guard reasonably against "wild-cat," operations.
A most erroneous opinion appears to be entertained, with regard to the value of non-dividend paying mines. The impression appears to be that if a mine, after a small expeuditure for development, does not pay a divide:d upon some fictitious value which its locators have seen fitto plăce upon it, the same must be abandoned as worthless. Of course the original stockholders in such an adventure are lousers; but if they can secure one first class mine out of a dozen ventures, the successful one affords ample remuneration for the failure of the eleven. But even the eleven are not lost to the community or State. According to the usual average of mining chances it is safe to calculate that at least five of the eleven will pay the ccotr of working, after they have been opened at the expense 0 the twelfth; and by a wise provision of all our local mining laws, if a mine is abandoned by its original locators, for a certain specified time, any other person, who may choose to do so, can come in and work it-so there is no probability of any mine lying idle which will pay its mere working expenses.

A mining community may grow up and flourish, even, in a neighborhood which does not possess a single dividend paying mine. To illustrate, we will take one of the princi-
pal mines in Washoe:-The Ophir, iu order to pay its present dividend of $\$ 48$ per foot, must yield $\$ 140,000$ per month about one half of which, or $\$ 70,000$, goes to pay expenses. Now it is quite evident, on a little reflection, that two mines, each employing the same number of men as the Ophir, but which are so poor as to barely pay the expense of working, are collectively worth more to the State in an industrial point of view, than the fabulously rich Ophir itself. Why? Because the too mines yield not only the same amount of bullion with the Ophir, but they also give employment to twi.e the number of men, at the mine; twice the number of foundrymen and machinists are employed to keep their works in repair and they draw twice the amount of supplies from San Francisco, that the Ophir does. Hence two
 share on Montgomery street may be actually of more value to the State and city than the famous Ophir which is valued to-day at $\$ 2,500$ per share! It is a fact, which to be known, needs only to be euquired into, that not one quarter of the aines in the State, whether placer or quartz, incorporated or private companies, liave ever paid a dollar over and above a fair rate of wuges to those employed upon them ; and yet, the State has cuntinued steadily to increase in wealth and population. San Franciscu has maintained a steady, onward progress, values have been created all over the State, millions of treasure bave continued to go East, each month, and Californiu has come to be regarded as the mineral wonder of the world. The fact is, so long as our mines are free to the prople and will merely continue to pay wages, just so lung, will California grow and prosper and San Francisco continue her onward progress.
We apprehend this is a view of our mining interest which is seldom taken; yet it is legitimate and correct, and furnishes a most convincing argument against the senseless tirudes of the croakers who are continually prophessing baukruptcy and ruin as the result of the present "mania," as they term it, in mining operations. The fact is, mining has but just been commenced. The immensity of our mineral developments is fairly overstepping bo hour population and capital.
Everything was just upon the point of ruin three years ago becanse they were paying $\$ 1,000$ for the Uphir, $\$ 400$ for the Gould \& Curry, $\$ 50$ tor Chollar, and less even for Hale \& Norcross, Potosi, etc ; while, as for such"wild-cat" mines as the Yellow Jacket, Best \& Belcher, and a score of other mines of acknowledged present value, they were mere schemes "to excite the hopes of simpletons and thereby rob them of their money." The croakers of those days now wish they had been "simpletons" then. Let the croakers of to-day learn wisdom from the past.

Tef Nelson Copper Mine.-The proprietors of this mine, which is located about six miles above Lincoln, on the. Nevada road, are making preparations for vigorous work in the way of its thorough development. A contract has been completed with a party for a quarter interest in the mine, to put up a 20 -horse power engine with the necessary pumping and hoisting apparatus. The claim consists of 2,000 feet. The usual croppings of carbonates are found upon the surface, and considerable native copper occurs at a depth of about 27 feet. A shaft has been sunk to the depth of 70 feet, with most promising indications.

The Netiton Mine.- This mine is now raising a large amount of very superior quality of ore. Of the 600 tons of ore which went forward by the Mary L. Sutton, this day week, as noticed in our last issue, 200 tons were from this mine, though not reported at the time. This mine has been shipping about 100 tons of ore per month for the past seven months. But little is said about it, from the fact that it is conducted by a private company, who are satisfied with doing business in a quict way. It is one of the most valuable mines in the State, and we are pleased to notice the progress of its development, as additional evidence of the increasing value of our Copper interest.

Lrature.-Dr. Bourne, a well known citizen, gives a free Lecture, every Friday Evening, at Dashaway Hall. Ourcotrmporaries speak favorably of these Lectures. They are pronounced both interesting and instructive by thuse who
have heard them.

## THE NEW SOUTHERN MINES.

Most extraordinary reports continue to reach us from the new mines in the San Francisco Mountains. These mines are located on the Agua Frio river, about 300 miles in an Easterly direction from San Diego. They have already boen prospected for an extent of 150 miles, throughout which extent, it is said gold is found everywhere. There is sufficient water for domestic purposes and for stock, and for mining with rockers only, but nôt fur slaicing or even for a tom. This is the report of prospectors who have recently gone over the country. Of course, when the rains set in the water will be more abundant. The climate is represented as being unsurpassed. Plenty of grass and timber; valleys Inxuriant, water in them to be found almost everywhere by digging a few feet.

## THE MINING SHARE MARKET.

A fair degree of interest has been manifested in Mining Matters during the past week. The "Mining Roll" hus ma. terinl y lengthened, and about the usual number of "Organizations," have been completely according to the $r$ quirements of the Incorporation Act. During the week we have published a list of $969 \mathrm{lncorporated} \mathrm{Mining} \mathrm{Conpanies}$, have their places of business in this city. Were the list complete it would, in all probability, exceed 1200.
An important feature of the week has heen the sale of the New Almaden Quicksilver Miving Company for the round sum of $\$ 1, \frac{5}{2} 0,000$. Payment is to be nade to-morrow. The negociation hus been conducted by telegraph. This sule will put an eud to the vexatious litigation in which this mine has been so long envolved, and will place beyond peradventure any further interference with the working of these mines, whose regular yield of quicksilver is of the utmost importance to the entire minir ginterest of the State.

Ophir Shares opened at $\$ 2,425$. The sales of the week reached 288 shares, at rates fluctuating between $\$ 2,425$ (a) $\$ 2,525$, and closing at $\$ 2,420$. The fluctuation has been owing to the uncer'ainty with regard to the approaching div. idend-operators being in doult as to whether the Company. after failing tn declare a dividend for last month, will be able to increase their dividend for the present month to their former standard of $\$ 72$ per foot.
Gould \& Curry shares have declined considerably during the week. Twelve shares only have changed hands since our last report at $\$ 4,750$ @ $\$ 4,775$. A dividend of $\$ 150$ per foot was declared on Wednesday. At the close of the week these shares were offered at $\$ 4,550$ without takers.
No transactions are reported in either Chollar or Hale \& Norcross.
Potosi shares have declined about $\$ 75$ dollars from last week's quotations and are now quoted at $\$ 900$ (a) $\$ 950$. They have been considerably sought after at $\$ 950$ on 30 days, hut cash is demanded.
Sierra Nevada have not been so much sought after as last week. They have declined somewhat with light transactions. They are quoted at $\$ 93 @ \$ 100$.
Daney shares have been largely dealt in at rates greatly fluctuating. Salcs of 1140 shares are reported at $\$ 100 @$ \$144. [The week previous 597 at $\$ 105 @ 150$.$] These trans-$ actions have been produced by variable reports from the mine, which is flooded. Much uncertainty exists as to the amonnt which will be required to put it in good condition again, which sum must be raised by assessments.
Buckeye has not attracted so much attention as for the two previous weeks. Sales of 283 shares at $\$ 34$ to $\$ 40$, closing at a slight advance on last week.
Burning Moscow is again attracting attention, at considerable advance. Sales of 202 shares are reported at $\$ 80 @$ $\$ 1081 / 2$. It closed the week with a firm market, at $\$ 105$ - \$20 improvement on dall sales of the previous week.

Savage. Transactions in this stock still continue light, and at declining rates. Sales of seven shares are reported at $\$ 3,300$. This Company has just declared its first dividend (payable to-day) of $\$ 50$ per foot. It is understood that \& balance of $\$ 35,000$ is retained for the purchase of winter supplies. \$80 per foot is confidently expected hereafter.

Overman, for which $\$ 510$ was bid at the close of the provious week without finding sellers, found buyers at $\$ 650$, early the past week, after which it declined to $\$ 465 \overline{\text {, closing }}$ at $\$ 475 . \$ 85$ better than the lowest bid of the week previous Seventy-two shares have changed hands duritiog the week.

Bultimore A merican has heen largely dealt in at remarkably tluctuating rates. Saled of 807 shares are reported ut 41 ( 1 , \$110. Thuee shares opened at $\$ 80$, whaneed to : 110 un 'Theaday, fell to stan on IVeducstay, then recovered it 855 , and finally clused the wouk at $\$ 30$ with a weak market.

| We notice further sales as follows: |
| :---: |
| White and Murphy ... 10 shares $\$ 700 \quad$ per foot. |

COPPER.
There is no apparant abatement in the Copper interest. New mines are constantly coming into notice, and the regular shipment from establisbed mines is constantly increasing.

The Newton mine, from which little has been heard of late, still continues its regular shipment of ores at the rate of about 100 tons per month.

The Napoleon still continues its usnal shipments, which appear to be limited only by the facilities for transporting the ore from the mine to steam naviga ion at Stockton. The daily reports from the mining Superiatendant are most encouraging, The lode is constantly improving. Two immense blocks of ore have been blasted out and raised from the main shaft, within a few days past, which will be placed on exhibition at the approaching fair at Stockton.

The Keystone is working a large force, and concentrating the lower grades of ore. Shares in this Company are held at $\$ 170$ per foot in Stockton, with $\$ 150$ offered.

Much interest is felt in the success of the concentrating machinery which is being put up by this company. Its success will add largely to the value of the copper intercat, not only at Copperopolis, but also in all other parts of the State.
'The Camp and McNulty Copper Company and Hughes claim are said to be pregressiug well.

The Josephine Company, is about contracting for 75 feet
of tutueling, which it is believed will bring them to the Napuleon lute.
There is a large amount of prospecting heing doue in the vicinity of Cu , peropulis, with most flattering indicutions of succes.
The Campo Seco Mines are repurted doing wrell and before the season clusps it is thonglit ore will be arain shinped from the Lancha Plana, Lono Star and Campo Seco Comfunies.
The Lanch Plana Company are turning out some excelInat rock. The Campo Nece Company have built a splendid water wheel on their clains for the purpose of pumpine out the water and raising the ore. The Lono Star Cumpany have struck pajing ore. There are several other claims which are reported as doing well.
Fifty-five tons of ore from the Well Lead, Nevada county, arrived at Sacramento the past week, in transitz for the Antioch Smeltiug Wurks. 'I'his is one of the earliest cupper mines opened in that acetion of the State, and it is expected the mine will, hereafter, bo able to ship that amount weekly, which amount will be gradually increased to fully a huadred tons within a few months.
The Home Company, located, if we mistake not, in El Dorado County, made their first important shipment of 20 tons of ore to this City during the nast week. This oro is to be shipped to Swansey by the Pacific Mineral Company of this City.

We have nothing of special interest from Butte or Dol Norte counties.

Consideruble attention is being directed to the copper mines of the Colorado. Some very valuable discoveries are reported most conveniently located for shipment down the river. A party in this city assured us, the past week, that he had assayed ore from sixteen different lode within a few days all from that region, none of which fell below twenty-five, and from that up to eighty per cent.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents-Americau, English,French and Belyiau-will secure an inventor exclusive monoply to his discovery among one huodred millions of the most intelligent people in the world.
The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at homs. The majority of all patents taken out by Americans in toreign countries are cbtained through the Mining and Sgientiflc Press Patent Agency. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dis* patch.
Models are not required in any European country, but the utmost care ond experience is necessary in the preparation of the specifications and drawiugse
When parties intend to take out foreign patents, engravingsshould not be published natil the fureign applications have been made.
Cavtion,-It has hecome a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. . We caution the latter against beeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at nome.
While it is true of Most European conntries that the system of examination is notso rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds a purchuser for his invention, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Tae Colorado River Trade．－Gentlemea recently from the Colorado state that busi－ ness along that river is brisk，in consequence of the extensive mining operations going on in that region．＇Three steamers are now ply－ ing on the river and another is in process of construction．The channel of the river is being sounded，with a view to patting on a still larger line of boats．Vessels clear from this port for the mouth of the Colorado，where they discharge their cargoes into the steam－ ers，which transport them thence up the riv－ er to the mines．It is anticipated that there will soon be shipped hither tull cargoes of copper ore from this rich，yet comparatively undeveloped region．

Tre＂Los Angeles Consolidated，Copper Gold and Silver Mining Co．，＂located in the Soledad Mining District，was incorporated on the 28th of January last，and have heen work－ ing since the 3 d of February，on the＂Miller＂ Copper Lode，with following results．This Company has also commenced running a tun－ nel on the Spence Native Copper Lode，on which they have attained a depth of 80 －feet． But little of the stock has been offered in this market，publicly，although a considerable amount has changed hands at faom $\$ 7$＠$\$ 10$ per foot．
Treasere from the North．－The Seirra Nevada arrived from Victoria on Thursday last，bringing down the handsome sum of $\$ 440,355$ ，in treasure．
This dust is mostly from the Bannock mines，in Idahoe．This arrival also speaks of a large yield of about thirty claims at Ca － riboo，which is reputed as averaging about $\$ 1,600$ each per month．

Tee Ophir Mine．－－The Virginia City Union of 20th August，says：
The new and rich vein struck in the Ophir a few weeks since continues to hold out well， a large ameunt of ore being extracted daily． It has been openee for a distance of fifty， and about twentp－five laborers are constantly engaged in still further developing it．A shaft is being sunk about fifty yards north－ west of the engine house，and a new and substantial track has been laid from it to the dump pile．A vast amount of earth bas al－ ready been removed by the new drifts．The ＂care＂still looks as if it were a lucky strike． Ore is not yet being taken from the lower mine．

How Surdiers Distroy Rati-roadg.-A lotter from Gen. Grant's army to The Springfield (III) Jou, nal, describing the recent uperations of our forces near Jackson, says:
Our operations on the railruad were of a novel character.
The regiment would be formed into line on one side of the track, and at the command every man would take hold on the end of a tie or a rail, and, straightning op, would lift the track from its bed, completely capsizing it. I'hen, piling the ties together and setting them on fire, we laid the rails across rendering them unfit for future use.,

THE REAL DEL MONTE MNE AND MOLLA
One of the most promising mining enterprises on the Faatern Slope, at the present tim $n$, is that of the Real del Monte, Consolidated Guld and Silver Mining Co. The Company is now putting up a mill, which will bo s cond to none on this Cuast. Its cost will be about $\$ 150,000$. The location of mill is described by a correspondent of the Alla as a pleasant sitmation at the junction of Bodie Creek and Esfmeralda Gulch, about two miles from the mines of Last Chance Hill. The main building is 160 by 60 feet, with an ngine room ndjoining, 36 by 47 feet. The mill will have 30 stamps, with 24 of Wheeler's pans, and 12 separators. The rock, on reachiug the inill, first passes under two ponlerous stanps or "spallers," weighing 1500 tbs, each, worklog upon dies, enclosed by iron grating. - These stamps have hree feet fall a nd merely break the rock sufficiently fine to fass thence under the battery. This crushing apparatns is placed in front of the battery, and at a convenient elevafion above it. The will is capable of crusbing about 45 cons of rock per day, and will be in full nperation about the first of November next.

## tie enalive.

The Mill is to be driven by a beam Engine, having a cylin der of 16 -inch bore with 36 -inch struke, with balance valves of the most approved style, aed Winter's variable cutoff arrangement, which gives the engineer the most perfect command of the steam, from the full stroke down to threeighte.
This Engine has been built at the Miners': Foundry, where he finishing work is now being put upon it, and is one of the nest pieces of work in that line which has ever been turned at on the Pacific Coast.
In the design of this Engine the gothic stgle of archibeture has been generally observed. It is constructed upon substantial foundation, 17 feet long and $51 / 2$ wide, securely bbed and bolted. Two gothic arches rise from the centre If the foundation plate, as supports for the beams, which are pautifully ornamented and painted with Union emblems, mong which appear, at diffierent points, 13 hrilliant stars, he whole surmounted with an elegant gilt eagle. In frunt the Engine, is a convenient platform from which two colmans arise, the one on the left containing the throttle valve, nd that on the right the unhooking gear. They are so aranged that the engineer can readily work both at the same foe, and also work the engine by hand, without changing is position.
One peculiarity, deserving of especial attention, connectd with this Engine, is the arrangement of a rotary cam or rek shaft for working the valves. One important advantage laimed for this arrangement is that the valves may be open1 and closed very quickly; another advantage grows out o te facility with which the exhaugt valve may be made to llow the stean palve at exactly the proper distance-a reIlt impossible to he a"curately obtained with a vibratiog raft. The rotation of the can shaft is obtained by susanding the excentric rod by a movable link attached to its ntre. This, we believe, is the first tine this motion has en applied to a steam engine on this coast. The govern-
or is conveniontly arranged and is exactly halaneed, and, mmuing by a gear, is not liable to any possibility of irregularity in motion; aud will throf to the eugine at the slightest appreciable increase of speed.
This machine was designed and dranghted by Mr. 1. M. Scotr. The entire wark, both in desing and execation refiects great credit upon the par ie's named. It will be driven by two tubular boilers, each 16 feet long and 50 inches in diameter. The balance wheel, which is cast in sections, is 18 feet in diameter and weighs about five tons. Wheu this mill is in full operation, our friends in Aurora, will be able to point out to visitors in that region a mill and engine, which in completer ess and substantial fuish, will compare favorably with anything in Virginia City, not forgetting the famous Ophir or justly lauded Gould \& Carry Mills.
The Aurora lode, one of the Company's Consolidation claims, is in splendid working order. The lode has been opened out in chambers or tunnels, intersecting for the distance of 400 feet, by which means 100 tons can be taken from the mine daily. The face of the ledge is now 16 to 18 feet wide, all pay reck, and will average from $\$ 125$ to $\$ 150$ per ton. The richest of the ore taken from the mine, is be ing sacked and reserved until their mill is ready for active operation.

## LARGE BRASS CASTING.

Passing by the Miners' Foundry, á few days since, our attention was directed to a large piece of brass work upon which the workmen were eugaged in the area just above the Office. On enquiry, we learned that itt was designed for a double acting Force Pump for the "Silver State Redaction Works."
The Cyliuder was a 14 inch bore, allowing a 36 -inch stroke, and weighing 1600 Ibs.'. This, we believe, is the largest brass casting ever made on this coast. It was handsomely finished, with two valve chambers of cast iron, each surmounted with a copper air dome, four feet high and 22 inches in diameter. The suction and discharge pipes were each 12 inches diameter. The work was designed by Mr. I. M. Scott, Draughtsman for the Miners' Foundry, and anpears to be especially well adapted for the work for which it is designed. It is the intention of the Company to place this punp in their mill for the purpose of meeting the exigency of fire. A large tank will be placed upon the comb of the roof, extending its entire length, with its floor or bottom perforated with a large number of bol s , thus making it like a seive. In case of fire this force pump will be set in motion, throwing a constant 12 -inch culumn of water into the tank, which will thence be distributed over the roof and down the sides of the building, thus enveloping it in a complete sheet of water, while for the inside, hose are attached to the bottom of the tank in sucha manner as to completely flood the interior of the building at the same tine. The idea is a most excel lent one, and we would suggest its adoption by by all out
arge mill establishments. Such an arrangement, kept in working order, with power at hand for' instant application, must be an effectual saferuard against any possihle serious

## THE GOLD MINES OP WALES, (ENG.)

The English papers are still giving farorable accounts from the gold mines of Wales. Mr. J. Musheimer, formerly of this city, now operating in those mincs, writes to the London Mining Journal, of July 18th.; as follows:-

To prove that the gokl fields of Wales are not yet exhausted, I will pive you a few facts of a new discovery near Balu, in the so-c'alled Custle Com Dockan Mines. The lorde is directly under the ruins of an old castle, aml no doubt, the former oceupants built their strong holl th guurd their treusure underneath. It is remarkable that the gold there had not been discovered long befure this, as ull the loose bouldeas on the ground contain visible gold, and even in the wall built with those boulders the gold could be seen. "The finding of this valunhle discovery is due to a boy of about twelve years of age who, while plaving, rnong those rocks, fonnd gold in perfectly white quartz. The property is worked by a company who have opened the lode to a depth of 20 feet, where it is three feet wiae, with decomposed quartz."
Mr. Mosheimer took a sample of the rock, and subjected it to a practical working by crushing and amalgamating, and obtained a yield at the rate of ten ounces to the ton. The Company has ordered machinery for the mine, which will be put ap with all convenient dispatch.
One Johu Penry communicates to the same issue of the Journal the following: -
"It is likely rome of your readers will be glad to learn that I have discovered, this week, in one of our mountain hills, a lode containing splendid visible gold. This is a great encouragement to go od still with our efforts, and I dare say this discovery will have great influence 'on the interest of several mines' siturated around it." 'You may expect some further particulars with regard to this very shortly."

## GOLD IN SCOPLAND.

Scotland contains both gold and silver mines. Gold is not anfrequently found on the mountain sides; -after heavy rains, in grains or attached to pieces of quartz and saphire. There s a gold mine on Crawford Moor and another on Fryer Moor, in Oleydesdale. "There are also two other mines in Widsdale, and three on Glangaker Watten, in the Forest of Attire. One Cornelius once discovered a gold mine at Crawford John, and in thirty days time took to the mint, at Edinburg, eight pounds of native gold, worth about $\$ 22,000$. Scotland also contains valuable mines of lead, iron, copper,

The Corper Mines of Prussia. - The high price of copper has caused a greater activity than usual in the copper mines of Prussia within the past two years. The produce of 1861 was 2273 tons against 1964 tons in 1860. The average yield of ore not far from 300 tons to each mine worked.

Powfr of Powder. - A distinguished engineer officer, who took a prominent part in the bombardment of Fort Pulaski, has made a calculation based upon the destruction caused by the late powder explosion in Eighty-ssxth street, New York City-that had our artillery succeeded in exploding the enemy's magazine at Fort Pulaski, to which its main effort was directed, the result would have been the annihilation of both the opposing forces. No man would have been lelt to tell the tale, no stoue left upon another to mark the sight of the contending foes.

## THE MINELS' LABORATORY-NO. XIV.

## SILVER

Kerale.-Choride of silver, Hornsilver. No cleavage observable. Fracture conchoidal; uneven, earthy, transparent, translucent on the edges. Lustre waxy inclining to adamantine. Poarl-grey, passing into various slades of blue and green, yellowish white. Grows brown when exposed to light, Streak shining maleable, anä̀ sèctile. Specific gravity, 5.55 to 5.60 . Before the blow-pipe, melts very easily, with ebulition, and is gradually reduced into a globule of silver in the inuer flame. Is redueed when rabbed with water on iron or zinc. Soluble in anmmonia and cryptalizes from the solution in octahedrons.

| analysis of the mineral kerate. |  |  |  |

| Red uxide of Iron, | 6.00 |  |  |
| Alumina, | 1.75 | - |  |
| Sulphuric Acid. | 0.27 |  |  |

This ninerals is found in crystals, reniform, investing other substances and massive in veins in the older rocks with some of the other oers of silver, is found in nearly all the silver bearing localities-considerable quantity is found of it in the California and Nerada silver mines,
Emboblite--Fracture hackly, Fustre adamaritine, sulphur yellow; siskin-green on a freshly fractured surface; olivegreen on the exterior perfectly malleable. Spacific gravity 5.789 to 5.806 .

> Chlorine,
> Silver,
> $\begin{aligned} & 13.05 \\ & 66.86\end{aligned}$

Bromite.-Bromide of silver-Bright, olive green, passing into yellow, acquires a grey tarnish, streak siskin-green; spicific gravity, 5.8 to 6.0

It melts very easily before a blowpipe. Is butfeebly acted upon by acids, soluble in warm concentrated ammonia.

## analysis of a specimen from mexico.

> Bromine. 52.5

Is found rather abnndantly in very small crystals and crystaline grains, with Lerate and cerussite in the mine of Sanonofre in the district of Plateros in Mexico, and with Kerate in the silver mines of Copiapo in Chile.

Iodite.-Iodide of Silver-Transparent, translucent, lustre resinous, approaching to adamantine,' 'yollowish-grey, greenishyellow, streak shining, spicifce' gravity 5.504.

Before the blowpipe on charcoal it becomes red; melts wery easily and imparts a purple-color to the flame; in the inner flame yields a globule of silver; soluble in concentrated nitric and bydrocloaic acids with evolution of vapor of iodine.

Blende-Sulphuret of Zine; very frequently contains small quantities of both gold and silver. There is not anything in the appearance of the blende to indicate the presence of silver. Should parties come across deposits of this mineral, it would be better that they pass it over to the hands of an experenced assayer, to prove the presence of the precious metal and also to what extent.

THE ANTYOCH SMELTING WORKS FIRIVG UP.
We have been informed that the furnace of the California Copper'Smelting Works, at Antioch, has been in operation since the 2 vd of this month, but they are not ready to smelt as yet; the Superintendant requiring some two or three weeks to heatand prepare the furnace. We shall soon be able to form an accurate idea as to the value of Mount Diablo coal for metallurgical purposes. The furance, we understand, is to all intents of the same kind as those now in use at Swansea, South Wales, Great Britain, with the exception of the fire place, which has been modified so as to all low the use of the lignite coal. Should this coal produce the necessary heat for the smelting of copper, we see no reason why the present enterprise would not be a profitable one; and it so, at no very distant date, we shall have other manufactories of a similar character, along the foot bills of old Diablo, on the sides of the road leading thither and along the banks of the San Joaquin. Our hearty wish is success and good luck to the young copper smelters.

## BATTLES AND RAINS.

The theory of Professor Espy that rain may be produced in any locality by that disturbance of the atmophere which results from great or continued conflagations, is supposed to have found confirmation during the present rebellion. It has certainly been remarked that rain showers of considerable violence and duration have generally followed or attended all the great battles of the present war, in which an unusual proportion of the heaviest class of ordinance has been employed. Indeed, it would appear by accounts form the South, that the very climate of that region, has been effected during the past and present season. The usual diseases peculiar to many localities, there, have been almost unknown. The weather has been cooler than usual, more xain has fallen and the atmosphere appears to have assumed a more bealthgiving and envigorating influense than ever before known during the Summer season. Whether this is attributable to to the chemical effects of burning such an immense amount of "villianous Saltpetre," or to the tremendous coneussions produced by the extraordinary weight and amount of artillery employed, or to some other cause may at some future time be made a matter of serious enquiry.
Unfortunately for the theory of Professor Espy, however, the circumstance that rains usually follow great battles, was a noticable and recorded fact even before the employment of firearms in war. An Eastern cotemporay has hunted up the following paragraph, which occurs in Platarch's life of Cains Marius, who, in speaking of a great battle that oe curred some fifteen hundred years before the use of gun-powder in Europe, says :-
The opivion of Arcbicolos is confirmed, that fieldseare fattened with blood. It is observed, indeed, that extraodinary rains generally fall after great battles; whether it be that some dei'y chooses to wash and purify the earth with water above, or whether the blood aud corruption, by the moist and heary vapors they emit, thicken the ains which is liable to be altered by the smallest cause."

Tere Pacific Montely for September has been laid upon our table. Its contents are, as usual, varied and interesting and marked with a good degree of literary ability. We notice especially a very yaiuable article on "The Mines of California," from the pen of Joha S. Hittell, Esq.

## NEW THEORY OF THE GENERATION OF STEAM.

We have now before us the second edition of Mr. Williar work "On Heat, in its Relations to Water and Steam; e bracing new riews of Vaponization, Condensation and F plosions," in which the new theory is carefully demonstrat Mr. Williams considers the subject under thirteen heads, cluding the three states of water, Vaporization, diffusion vapor, heating and expanding of water, the boiling poi ebullition, vapor in water, condensation, the vacuum, evap, ation, spontaneous evaporation, explosions and the jet, spectively. The position which Mr. Williams maintains that there are sufficient scientific and reasonable grounds asserting that water, or its atoms, can neither be heated i expanded, and still retain the character of liquidity, and 1 property of attraction among their follow- atoms ; that prevailiug theories as regards ebullition are altogether erri eous; that the so-called boiling point, as regards tempe ture, is merely that point at which the water is charged w rapor to saturation, under the true Daltonian theory, the: ter acting the part of a mere vacuum ; that we have stro grounds for velieving that there is no difference between 1 cause which produces divergence and mutnal repulsion anio the atoms of a liquid on becoming vapor, and that whit produces a similar divergence and repulsion in the pith be or gold leaves of the electroscope ; that if there be such thing as thermo-electricity, we are warranted in conclud that it acts in the same way, and on a similar principle, atoms of a liquid as on those pf other bodies; that we hi rational grounds for beliving that explosions in steam boil are frequently the result of the accumulated steam (pres in the body of the water) being suddenly released by the moval of the pressure from the denser medium of the wa into the lighter one of the air; that Watt's theory of ste. being condensed and reconverted into the liquid state by direct action of cold water is altogether erroneous ; that val or steam cannot give out its heat to water, and is mis mechanically with it on the true Daltonian theory; and $t$ we have no grounds for inferring that there can be more uu of heat in the body of steam than there are distinct ato of the matter of water, each of such atoms having own equivalent of heat electrically or otherwise combir with it-accumlation being the sole grounds of expansion a pressure. In judging of the value of Mr. Williams's conc sions, it should be borne in mind that his experience, wh extends over a period of nearly half a century, has b gained in comnection with two of the largest and mosts cessful steam companies in the kingdom-the Peninsular Oriental Steam Navagation Company, and the City of Du Steam Packet Company, and that he has slways given attention to the subject.-London Mining Journal.
The London Mining Journal, in another issue, refers again to the above theory of the generation of steam, sper of a paper read before the Liverpool Literary and,Philoso oal Society, by Mr. E. J. Reed. The object of the paper to show that the first effect of applying artificial heat to ter is not to heat the water, as such, but to convert a tain portion of it into vapor. Mr. Williams (the discove of the new theory,) first drew attention to the fact that rise of the generated vapor, and its diffusion through liquid were plainly visible to the eye, a discovery wb seemed to have escaped all previous experimenters. Edwards; an analytical chemist of Liverpool, exhibitec beautiful experiment illustrative of this discovery, by me of an electrical light. On heat being applied to a glass sel containing water, instead of the series of ascending decending currents described by all previous writers, a c tinuous movement upwards of cloud-like vapor was $m$ visible to the audience. After explaining this discovery length, and demonstrating that the movements made visi were those of vapor and not heated currents of water, author dreve several important inferences from the phenom non, such as that it is untrue to say, as many authors do, t vapor is formed at the surface of water only; that wa even when of a low temperature does not condense vapore., reconvert it into water; that water is capable of conts ing, and, when what is called warm or bot, does contain condensed vapor or steam. It was urged that Mr. Willian discovery rendered a revision of the common theory urgi ly necessary.
An Electric Dog.-There is at Dayton, (says the Viry City Bulletin $n_{3}$ ) decidedly the greatest phenomenon of present day. It is no less than an electric dog, which rubbed on the back by a human hand and the other pla on the dog's belly, the person experimenting will receive electric shock equal to that of any battery. This sing canine is said to pessess properties for curing rheamati gout and all other complaints sabject to cure by the batt
